It is appreciated that GAM337013 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337013 target genes. The mRNA of each one of this plurality of GAM337013 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337013 RNA, herein designated GAM RNA, and which when bound by GAM337013 RNA causes inhibition of translation of the GAM337013 target mRNA into a corresponding GAM337013 target protein.

The mechanism of the translational inhibition exerted by GAM337013 RNA, herein designated GAM RNA, on one or more GAM337013 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337013 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337013 RNA, herein designated GAM RNA, of GAM337013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337013 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337013 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337013 RNA correlate with, and may be deduced from, the identity of the GAM337013 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337015 6423 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCTGGGAGG Messenger 337015 (GAM337015) oligonucleotides modulates expression of respective target
CGGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCCAA GAM337015 is a novel bioinformatically detectable regulatory, non protein
GGTCGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337015 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGGGCAAA encoded by the human genome.

ACTCTGTCTC GAM337015 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337015 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337015 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337015 precursor RNA is designated SEQ ID:6423, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6423 is located from position 65550880 to position 65550979 relative to chromosome 3 on the `-` strand.

GAM337015 precursor RNA folds onto itself, forming GAM337015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337015 precursor RNA, designated SEQ ID NO: 6423, and a schematic representation of a predicted secondary folding of GAM337015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337015 folded precursor RNA yielding a GAM337015 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337015 RNA, hereby incorporated herein. Expression of GAM337015 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337015 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337015 target RNA, herein designated GAM TARGET RNA.

GAM337015 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337015 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337015 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337015 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337015 RNA, herein designated GAM RNA, to target binding sites on GAM337015 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337015 target RNA into GAM337015 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337015 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337015 target genes. The mRNA of each one of this plurality of GAM337015 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337015 RNA, herein designated GAM RNA, and which when bound by GAM337015 RNA causes inhibition of translation of the GAM337015 target mRNA into a corresponding GAM337015 target protein.

The mechanism of the translational inhibition exerted by GAM337015 RNA, herein designated GAM RNA, on one or more GAM337015 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337015 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337015 RNA, herein designated GAM RNA, of GAM337015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337015 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337015 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337015 RNA correlate with, and may be deduced from, the identity of the GAM337015 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337016 5990 CAAGTTTGGT Fig. 8 further provides a conceptual description of another novel bioinformatically
CAAGGGGTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGTGTCCGA Messenger 337016 (GAM337016) oligonucleotides modulates expression of respective target
CTCCAAGGAG genes whose function and utility is known in the art.

CATCTCCGTT GAM337016 is a novel bioinformatically detectable regulatory, non protein
TCTGAGTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337016 was detected
AACTCTCATG is described with additional reference to Figs. 9-15.

ACACTGTGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTTGCCTCA encoded by the human genome.

GGCTTG GAM337016 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337016 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337016 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337016 precursor RNA is designated SEQ ID:5990, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5990 is located from position 65582433 to position 65582528 relative to chromosome 9 on the `+` strand.

GAM337016 precursor RNA folds onto itself, forming GAM337016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337016 precursor RNA, designated SEQ ID NO: 5990, and a schematic representation of a predicted secondary folding of GAM337016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337016 folded precursor RNA yielding a GAM337016 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337016 RNA, hereby incorporated herein.

GAM337016 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337016 target RNA, herein designated GAM TARGET RNA.

GAM337016 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337016 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337016 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337016 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337016 RNA, herein designated GAM RNA, to target binding sites on GAM337016 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337016 target RNA into GAM337016 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337016 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337016 target genes. The mRNA of each one of this plurality of GAM337016 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337016 RNA, herein designated GAM RNA, and which when bound by GAM337016 RNA causes inhibition of translation of the GAM337016 target mRNA into a corresponding GAM337016 target protein.

The mechanism of the translational inhibition exerted by GAM337016 RNA, herein designated GAM RNA, on one or more GAM337016 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337016 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337016 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337016 RNA, herein designated GAM RNA, of GAM337016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337016 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337016 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337016 RNA correlate with, and may be deduced from, the identity of the GAM337016 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337017 7201 TGCGGGCAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
ATCACATATT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGCAGAAAA Messenger 337017 (GAM337017) oligonucleotides modulates expression of respective target
CAATTCCAAG genes whose function and utility is known in the art.

CAAGGAGAGT GAM337017 is a novel bioinformatically detectable regulatory, non protein
TGCTGGGATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337017 was detected
ATTCTGCTCT is described with additional reference to Figs. 9-15.

GGTCGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337017 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337017 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337017 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337017 precursor RNA is designated SEQ ID:7201, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7201 is located from position 65582733 to position 65582809 relative to chromosome 9 on the `+` strand.

GAM337017 precursor RNA folds onto itself, forming GAM337017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337017 precursor RNA, designated SEQ ID NO: 7201, and a schematic representation of a predicted secondary folding of GAM337017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337017 folded precursor RNA yielding a GAM337017 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337017 RNA, hereby incorporated herein.

GAM337017 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337017 target RNA, herein designated GAM TARGET RNA.

GAM337017 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337017 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337017 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337017 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337017 RNA, herein designated GAM RNA, to target binding sites on GAM337017 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337017 target RNA into GAM337017 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337017 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337017 target genes. The mRNA of each one of this plurality of GAM337017 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337017 RNA, herein designated GAM RNA, and which when bound by GAM337017 RNA causes inhibition of translation of the GAM337017 target mRNA into a corresponding GAM337017 target protein.

The mechanism of the translational inhibition exerted by GAM337017 RNA, herein

designated GAM RNA, on one or more GAM337017 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337017 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337017 RNA, herein designated GAM RNA, of GAM337017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337017 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337017 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337017 RNA correlate with, and may be deduced from, the identity of the GAM337017 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337018 5884 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337018 (GAM337018) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337018 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337018 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337018 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337018 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337018 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337018 precursor RNA is designated SEQ ID:5884, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5884 is located from position 65709159 to position 65709240

relative to chromosome 1 on the `-` strand.

GAM337018 precursor RNA folds onto itself, forming GAM337018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337018 precursor RNA, designated SEQ ID NO: 5884, and a schematic representation of a predicted secondary folding of GAM337018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337018 folded precursor RNA yielding a GAM337018 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337018 RNA, hereby incorporated herein.

GAM337018 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337018 target RNA, herein designated GAM TARGET RNA.

GAM337018 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337018 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337018 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337018 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337018 RNA, herein designated GAM RNA, to target binding sites on GAM337018 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337018 target RNA into GAM337018 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337018 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337018 target genes. The mRNA of each one of this plurality of GAM337018 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337018 RNA, herein designated GAM RNA, and which when bound by GAM337018 RNA causes inhibition of translation of the GAM337018 target mRNA into a corresponding GAM337018 target protein.

The mechanism of the translational inhibition exerted by GAM337018 RNA, herein designated GAM RNA, on one or more GAM337018 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337018 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337018 RNA, herein designated GAM RNA, of GAM337018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337018 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337018 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337018 RNA correlate with, and may be deduced from, the identity of the GAM337018 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337019 5885 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337019 (GAM337019) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337019 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337019 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337019 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337019 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337019 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337019 precursor RNA is designated SEQ ID:5885, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5885 is located from position 65710652 to position 65710733 relative to chromosome 5 on the `+` strand.

GAM337019 precursor RNA folds onto itself, forming GAM337019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337019 precursor RNA, designated SEQ ID NO: 5885, and a schematic representation of a predicted secondary folding of GAM337019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337019 folded precursor RNA yielding a GAM337019 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337019 RNA, hereby incorporated herein.

GAM337019 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337019 target RNA, herein designated GAM TARGET RNA.

GAM337019 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337019 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337019 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337019 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337019 RNA, herein designated GAM RNA, to target

binding sites on GAM337019 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337019 target RNA into GAM337019 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337019 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337019 target genes. The mRNA of each one of this plurality of GAM337019 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337019 RNA, herein designated GAM RNA, and which when bound by GAM337019 RNA causes inhibition of translation of the GAM337019 target mRNA into a corresponding GAM337019 target protein.

The mechanism of the translational inhibition exerted by GAM337019 RNA, herein designated GAM RNA, on one or more GAM337019 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337019 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337019 RNA, herein designated GAM RNA, of GAM337019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337019 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337019 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337019 RNA correlate with, and may be deduced from, the identity of the GAM337019 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337022 7351 TTTTGGTAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GACATTCATC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAGTCGTTT Messenger 337022 (GAM337022) oligonucleotides modulates expression of respective target

CTCTCTCCCA genes whose function and utility is known in the art.

GCTTGACCTT GAM337022 is a novel bioinformatically detectable regulatory, non protein

AGGTTAATAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337022 was detected

TTCATTTGGG is described with additional reference to Figs. 9-15.

TCAAGAAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AATATGTAGG encoded by the human genome.

AGAGCTATGT GAM337022 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGCTTTAACA GAM337022 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

AGA GAM337022 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337022 precursor RNA is designated SEQ ID:7351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7351 is located from position 65754862 to position 65754974 relative to chromosome 12 on the `+` strand.

GAM337022 precursor RNA folds onto itself, forming GAM337022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337022 precursor RNA, designated SEQ ID NO: 7351, and a schematic representation of a predicted secondary folding of GAM337022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337022 folded precursor RNA yielding a GAM337022 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337022 RNA, hereby incorporated herein.

GAM337022 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337022 target RNA, herein designated GAM TARGET RNA.

GAM337022 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337022 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337022 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337022 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337022 RNA, herein designated GAM RNA, to target binding sites on GAM337022 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337022 target RNA into GAM337022 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337022 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337022 target genes. The mRNA of each one of this plurality of GAM337022 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337022 RNA, herein designated GAM RNA, and which when bound by GAM337022 RNA causes inhibition of translation of the GAM337022 target mRNA into a corresponding GAM337022 target protein.

The mechanism of the translational inhibition exerted by GAM337022 RNA, herein designated GAM RNA, on one or more GAM337022 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337022 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337022 RNA, herein designated GAM RNA, of GAM337022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337022 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337022 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337022 RNA correlate with, and may be deduced from, the identity of the GAM337022 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337023 6550 GCTGTCCTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCCTGGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address
TACTAGAGGG Messenger 337023 (GAM337023) oligonucleotides modulates expression of respective target
TAAAGGAATG genes whose function and utility is known in the art.

GAACCATGTC GAM337023 is a novel bioinformatically detectable regulatory, non protein
TGGGGTCCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337023 was detected
TTAGTAACTT is described with additional reference to Figs. 9-15.

GCAGGGTCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGAATTGACT encoded by the human genome.

GC GAM337023 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337023 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337023 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337023 precursor RNA is designated SEQ ID:6550, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6550 is located from position 65815377 to position 65815468 relative to chromosome 7 on the `+` strand.

GAM337023 precursor RNA folds onto itself, forming GAM337023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337023 precursor RNA, designated SEQ ID NO: 6550, and a schematic representation of a predicted secondary folding of GAM337023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337023 folded precursor RNA yielding a GAM337023 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337023 RNA, hereby incorporated herein.

GAM337023 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337023 target RNA, herein designated GAM TARGET RNA.

GAM337023 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337023 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337023 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337023 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337023 RNA, herein designated GAM RNA, to target binding sites on GAM337023 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337023 target RNA into GAM337023 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337023 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337023 target genes. The mRNA of each one of this plurality of GAM337023 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337023 RNA, herein designated GAM RNA, and which when bound by GAM337023 RNA causes inhibition of translation of the GAM337023 target mRNA into a corresponding GAM337023 target protein.

The mechanism of the translational inhibition exerted by GAM337023 RNA, herein designated GAM RNA, on one or more GAM337023 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337023 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337023 RNA, herein designated GAM RNA, of GAM337023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337023 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337023 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337023

RNA correlate with, and may be deduced from, the identity of the GAM337023 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337024 7042 TCCTGAGGCC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGAGATACT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGAGGGTAAA Messenger 337024 (GAM337024) oligonucleotides modulates expression of respective target
GGAATGGAAC genes whose function and utility is known in the art.

CATGTCTGGG GAM337024 is a novel bioinformatically detectable regulatory, non protein
GTCCCTTTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337024 was detected
TAACTTGCAG is described with additional reference to Figs. 9-15.

GGTCTGGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337024 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337024 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337024 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337024 precursor RNA is designated SEQ ID:7042, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7042 is located from position 65815381 to position 65815459 relative to chromosome 7 on the `+` strand.

GAM337024 precursor RNA folds onto itself, forming GAM337024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337024 precursor RNA, designated SEQ ID NO: 7042, and a schematic representation of a predicted secondary folding of GAM337024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337024 folded precursor RNA yielding a GAM337024 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337024 RNA, hereby incorporated herein.

GAM337024 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337024 target RNA, herein designated GAM TARGET RNA.

GAM337024 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337024 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337024 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337024 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337024 RNA, herein designated GAM RNA, to target binding sites on GAM337024 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337024 target RNA into GAM337024 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337024 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337024 target genes. The mRNA of each one of this plurality of GAM337024 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337024 RNA, herein designated GAM RNA, and which when bound by GAM337024 RNA causes inhibition of translation of the GAM337024 target mRNA into a corresponding GAM337024 target protein.

The mechanism of the translational inhibition exerted by GAM337024 RNA, herein designated GAM RNA, on one or more GAM337024 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337024 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337024 RNA, herein designated GAM RNA, of GAM337024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337024 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337024 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337024 RNA correlate with, and may be deduced from, the identity of the GAM337024 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTATTTGTAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337025 was detected
ATTGGGGCTA is described with additional reference to Figs. 9-15.

TGAGGGTCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTGCTGTCCC encoded by the human genome.

TGCCA GAM337025 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337025 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337025 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337025 precursor RNA is designated SEQ ID:7224, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7224 is located from position 65938364 to position 65938458 relative to chromosome 11 on the `+` strand.

GAM337025 precursor RNA folds onto itself, forming GAM337025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337025 precursor RNA, designated SEQ ID NO: 7224, and a schematic representation of a predicted secondary folding of GAM337025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337025 folded precursor RNA yielding a GAM337025 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337025 RNA, hereby incorporated herein.

GAM337025 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337025 target RNA, herein designated GAM TARGET RNA.

GAM337025 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337025 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337025 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337025 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337025 RNA, herein designated GAM RNA, to target binding sites on GAM337025 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337025 target RNA into GAM337025 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337025 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337025 target genes. The mRNA of each one of this plurality of GAM337025 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337025 RNA, herein designated GAM RNA, and which when bound by GAM337025 RNA causes inhibition of translation of the GAM337025 target mRNA into a corresponding GAM337025 target protein.

The mechanism of the translational inhibition exerted by GAM337025 RNA, herein designated GAM RNA, on one or more GAM337025 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337025 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337025 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337025 RNA, herein designated GAM RNA, of GAM337025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337025 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337025 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337025 RNA correlate with, and may be deduced from, the identity of the GAM337025 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337027 7185 TGAGGTGGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGATTACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGCCCAAGAG Messenger 337027 (GAM337027) oligonucleotides modulates expression of respective target

GAGGAGGCTG genes whose function and utility is known in the art.

CAGTGAGTCA GAM337027 is a novel bioinformatically detectable regulatory, non protein

ACATTGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337027 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGTGTG encoded by the human genome.

ACCCCATCTC GAM337027 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM337027 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337027 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337027 precursor RNA is designated SEQ ID:7185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7185 is located from position 66122717 to position 66122817 relative to chromosome 7 on the `-` strand.

GAM337027 precursor RNA folds onto itself, forming GAM337027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337027 precursor RNA, designated SEQ ID NO: 7185, and a schematic representation of a predicted secondary folding of GAM337027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337027 folded precursor RNA yielding a GAM337027 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337027 RNA, hereby incorporated herein. Expression of GAM337027 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337027 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337027 target RNA, herein designated GAM TARGET RNA.

GAM337027 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337027 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337027 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337027 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337027 RNA, herein designated GAM RNA, to target binding sites on GAM337027 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337027 target RNA into GAM337027 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337027 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337027 target genes. The mRNA of each one of this plurality of GAM337027 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337027 RNA, herein designated GAM RNA, and which when bound by GAM337027 RNA causes inhibition of

translation of the GAM337027 target mRNA into a corresponding GAM337027 target protein.

The mechanism of the translational inhibition exerted by GAM337027 RNA, herein designated GAM RNA, on one or more GAM337027 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337027 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337027 RNA, herein designated GAM RNA, of GAM337027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337027 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337027 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337027 RNA correlate with, and may be deduced from, the identity of the GAM337027 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337028 6456 GAGGTGGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GATTACTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GCCCAAGAGG Messenger 337028 (GAM337028) oligonucleotides modulates expression of respective target
AGGAGGCTGC genes whose function and utility is known in the art.

AGTGAGTCAA GAM337028 is a novel bioinformatically detectable regulatory, non protein
CATTGCACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337028 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGTGTGA encoded by the human genome.

CCCCATCTC GAM337028 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337028 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337028 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337028 precursor RNA is designated SEQ ID:6456, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6456 is located from position 66122718 to position 66122816 relative to chromosome 7 on the `-` strand.

GAM337028 precursor RNA folds onto itself, forming GAM337028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337028 precursor RNA, designated SEQ ID NO: 6456, and a schematic representation of a predicted secondary folding of GAM337028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337028 folded precursor RNA yielding a GAM337028 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337028 RNA, hereby incorporated herein. Expression of GAM337028 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337028 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337028 target RNA, herein designated GAM TARGET RNA.

GAM337028 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337028 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337028 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337028 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337028 RNA, herein designated GAM RNA, to target binding sites on GAM337028 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337028 target RNA into GAM337028 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337028 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337028 target genes. The mRNA of each one of this plurality of GAM337028 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337028 RNA, herein designated GAM RNA, and which when bound by GAM337028 RNA causes inhibition of translation of the GAM337028 target mRNA into a corresponding GAM337028 target protein.

The mechanism of the translational inhibition exerted by GAM337028 RNA, herein designated GAM RNA, on one or more GAM337028 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337028 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337028 RNA, herein designated GAM RNA, of GAM337028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337028 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337028 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337028 RNA correlate with, and may be deduced from, the identity of the GAM337028 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337029 6983 TATGGGAAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAAAAAAGT Messenger 337029 (GAM337029) oligonucleotides modulates expression of respective target
ACATTTGGTA genes whose function and utility is known in the art.

TACATGCATA GAM337029 is a novel bioinformatically detectable regulatory, non protein
GAGATGTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337029 was detected
TAGCAAATGG is described with additional reference to Figs. 9-15.

TCTGAATGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGCCTTAGA encoded by the human genome.

CCACAGTTTT GAM337029 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CATA GAM337029 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337029 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337029 precursor RNA is designated SEQ ID:6983, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6983 is located from position 66268768 to position 66268871 relative to chromosome 14 on the `-` strand.

GAM337029 precursor RNA folds onto itself, forming GAM337029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337029 precursor RNA, designated SEQ ID NO: 6983, and a schematic representation of a predicted secondary folding of GAM337029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337029 folded precursor RNA yielding a GAM337029 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337029 RNA, hereby incorporated herein.

GAM337029 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337029 target RNA, herein designated GAM TARGET RNA.

GAM337029 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337029 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337029 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337029 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337029 RNA, herein designated GAM RNA, to target binding sites on GAM337029 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337029 target RNA into GAM337029 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337029 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337029 target genes. The mRNA of each one of this plurality of GAM337029 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337029 RNA, herein designated GAM RNA, and which when bound by GAM337029 RNA causes inhibition of translation of the GAM337029 target mRNA into a corresponding GAM337029 target protein.

The mechanism of the translational inhibition exerted by GAM337029 RNA, herein designated GAM RNA, on one or more GAM337029 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337029 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337029 RNA, herein designated GAM RNA, of GAM337029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337029 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337029 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337029 RNA correlate with, and may be deduced from, the identity of the GAM337029 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337030 7231 TGGGAAAAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCAGTTTAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AAAAAAGTAC Messenger 337030 (GAM337030) oligonucleotides modulates expression of respective target

ATTTGGTATA genes whose function and utility is known in the art.

CATGCATAGA GAM337030 is a novel bioinformatically detectable regulatory, non protein

GATGTGCATA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337030 was detected

GCAAATGGTC is described with additional reference to Figs. 9-15.

TGAATGAATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCCTTAGACC encoded by the human genome.

A GAM337030 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337030 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337030 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337030 precursor RNA is designated SEQ ID:7231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7231 is located from position 66268779 to position 66268869 relative to chromosome 14 on the `-` strand.

GAM337030 precursor RNA folds onto itself, forming GAM337030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337030 precursor RNA, designated SEQ ID NO: 7231, and a schematic representation of a predicted secondary folding of GAM337030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337030 folded precursor RNA yielding a GAM337030 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337030 RNA, hereby incorporated herein.

GAM337030 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337030 target RNA, herein designated GAM TARGET RNA.

GAM337030 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337030 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337030 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337030 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337030 RNA, herein designated GAM RNA, to target binding sites on GAM337030 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337030 target RNA into GAM337030 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337030 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337030 target genes. The mRNA of each one of this plurality of GAM337030 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337030 RNA, herein designated GAM RNA, and which when bound by GAM337030 RNA causes inhibition of translation of the GAM337030 target mRNA into a corresponding GAM337030 target protein.

The mechanism of the translational inhibition exerted by GAM337030 RNA, herein designated GAM RNA, on one or more GAM337030 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337030 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337030 RNA, herein designated GAM RNA, of GAM337030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337030 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337030 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337030 RNA correlate with, and may be deduced from, the identity of the GAM337030 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACTTGTTATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337031 was detected
CTGCTCAAGA is described with additional reference to Figs. 9-15.

GAATCCACCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCAGCTCTTG encoded by the human genome.

GCCT GAM337031 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337031 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337031 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337031 precursor RNA is designated SEQ ID:5765, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5765 is located from position 66387514 to position 66387607 relative to chromosome 16 on the `+` strand.

GAM337031 precursor RNA folds onto itself, forming GAM337031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337031 precursor RNA, designated SEQ ID NO: 5765, and a schematic representation of a predicted secondary folding of GAM337031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337031 folded precursor RNA yielding a GAM337031 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337031 RNA, hereby incorporated herein.

GAM337031 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337031 target RNA, herein designated GAM TARGET RNA.

GAM337031 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337031 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337031 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337031 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337031 RNA, herein designated GAM RNA, to target binding sites on GAM337031 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337031 target RNA into GAM337031 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337031 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337031 target genes. The mRNA of each one of this plurality of GAM337031 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337031 RNA, herein designated GAM RNA, and which when bound by GAM337031 RNA causes inhibition of translation of the GAM337031 target mRNA into a corresponding GAM337031 target protein.

The mechanism of the translational inhibition exerted by GAM337031 RNA, herein designated GAM RNA, on one or more GAM337031 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337031 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337031 RNA, herein designated GAM RNA, of GAM337031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337031 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337031 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337031 RNA correlate with, and may be deduced from, the identity of the GAM337031 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GCCTGGGCAA encoded by the human genome.

CAGAGTGAAA GAM337032 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CTCCATCATC GAM337032 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
ATCTCAA GAM337032 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337032 precursor RNA is designated SEQ ID:7332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7332 is located from position 66457769 to position 66457885 relative to chromosome 12 on the `+` strand.

GAM337032 precursor RNA folds onto itself, forming GAM337032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337032 precursor RNA, designated SEQ ID NO: 7332, and a schematic representation of a predicted secondary folding of GAM337032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337032 folded precursor RNA yielding a GAM337032 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337032 RNA, hereby incorporated herein. Expression of GAM337032 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337032 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337032 target RNA, herein designated GAM TARGET RNA.

GAM337032 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337032 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337032 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337032 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337032 RNA, herein designated GAM RNA, to target binding sites on GAM337032 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337032 target RNA into GAM337032 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337032 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337032 target genes. The mRNA of each one of this plurality of GAM337032 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337032 RNA, herein designated GAM RNA, and which when bound by GAM337032 RNA causes inhibition of translation of the GAM337032 target mRNA into a corresponding GAM337032 target protein.

The mechanism of the translational inhibition exerted by GAM337032 RNA, herein designated GAM RNA, on one or more GAM337032 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337032 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337032 RNA, herein designated GAM RNA, of GAM337032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337032 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337032 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337032 RNA correlate with, and may be deduced from, the identity of the GAM337032 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337033 6620 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAGCCCCG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCAGGGG Messenger 337033 (GAM337033) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGATTGT GAM337033 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337033 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAACTCC encoded by the human genome.

GAM337033 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337033 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337033 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337033 precursor RNA is designated SEQ ID:6620, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6620 is located from position 66457785 to position 66457872 relative to chromosome 12 on the `+` strand.

GAM337033 precursor RNA folds onto itself, forming GAM337033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337033 precursor RNA, designated SEQ ID NO: 6620, and a schematic representation of a predicted secondary folding of GAM337033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337033 folded precursor RNA yielding a GAM337033 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337033 RNA, hereby incorporated herein. Expression of GAM337033 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337033 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337033 target RNA, herein designated GAM TARGET RNA.

GAM337033 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337033 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337033 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337033 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337033 RNA, herein designated GAM RNA, to target binding sites on GAM337033 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337033 target RNA into GAM337033 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337033 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337033 target genes. The mRNA of each one of this plurality of GAM337033 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337033 RNA,

herein designated GAM RNA, and which when bound by GAM337033 RNA causes inhibition of translation of the GAM337033 target mRNA into a corresponding GAM337033 target protein.

The mechanism of the translational inhibition exerted by GAM337033 RNA, herein designated GAM RNA, on one or more GAM337033 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337033 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337033 RNA, herein designated GAM RNA, of GAM337033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337033 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337033 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337033 RNA correlate with, and may be deduced from, the identity of the GAM337033 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337035 6249 CTTAAGTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTGCAGTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGTGTGTAT Messenger 337035 (GAM337035) oligonucleotides modulates expression of respective target

GTCTGTGTGT genes whose function and utility is known in the art.

GCATGCACGC GAM337035 is a novel bioinformatically detectable regulatory, non protein

ACATGTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337035 was detected

ATGCAGCAGG is described with additional reference to Figs. 9-15.

GAGAGTGGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTAAG encoded by the human genome.

GAM337035 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337035 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337035 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337035 precursor RNA is designated SEQ ID:6249, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6249 is located from position 66813729 to position 66813813 relative to chromosome 12 on the `+` strand.

GAM337035 precursor RNA folds onto itself, forming GAM337035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337035 precursor RNA, designated SEQ ID NO: 6249, and a schematic representation of a predicted secondary folding of GAM337035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337035 folded precursor RNA yielding a GAM337035 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337035 RNA, hereby incorporated herein.

GAM337035 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337035 target RNA, herein designated GAM TARGET RNA.

GAM337035 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337035 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337035 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337035 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337035 RNA, herein designated GAM RNA, to target binding sites on GAM337035 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337035 target RNA

into GAM337035 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337035 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337035 target genes. The mRNA of each one of this plurality of GAM337035 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337035 RNA, herein designated GAM RNA, and which when bound by GAM337035 RNA causes inhibition of translation of the GAM337035 target mRNA into a corresponding GAM337035 target protein.

The mechanism of the translational inhibition exerted by GAM337035 RNA, herein designated GAM RNA, on one or more GAM337035 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337035 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337035 RNA, herein designated GAM RNA, of GAM337035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337035 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337035 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337035 RNA correlate with, and may be deduced from, the identity of the GAM337035 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337036 6824 GGGTGTGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAACATCCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCCCTTGTT Messenger 337036 (GAM337036) oligonucleotides modulates expression of respective target

TTCAACCTAG genes whose function and utility is known in the art.

TAGGCCAGTT GAM337036 is a novel bioinformatically detectable regulatory, non protein

TAGAAACAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337036 was detected

CCACAGGGAA is described with additional reference to Figs. 9-15.

GGTGTTGTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTCATTACTC encoded by the human genome.

GAM337036 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337036 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337036 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337036 precursor RNA is designated SEQ ID:6824, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6824 is located from position 66902019 to position 66902108 relative to chromosome 16 on the `+` strand.

GAM337036 precursor RNA folds onto itself, forming GAM337036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337036 precursor RNA, designated SEQ ID NO: 6824, and a schematic representation of a predicted secondary folding of GAM337036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337036 folded precursor RNA yielding a GAM337036 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337036 RNA, hereby incorporated herein.

GAM337036 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337036 target RNA, herein designated GAM TARGET RNA.

GAM337036 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337036 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337036 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337036 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337036 RNA, herein designated GAM RNA, to target binding sites on GAM337036 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337036 target RNA into GAM337036 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337036 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337036 target genes. The mRNA of each one of this plurality of GAM337036 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337036 RNA, herein designated GAM RNA, and which when bound by GAM337036 RNA causes inhibition of translation of the GAM337036 target mRNA into a corresponding GAM337036 target protein.

The mechanism of the translational inhibition exerted by GAM337036 RNA, herein designated GAM RNA, on one or more GAM337036 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337036 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337036 RNA, herein designated GAM RNA, of GAM337036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337036 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337036 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337036 RNA correlate with, and may be deduced from, the identity of the GAM337036 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337037 6785 GGGAGAGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGTGAGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGAGGTGTC Messenger 337037 (GAM337037) oligonucleotides modulates expression of respective target

AGGAATGAAA genes whose function and utility is known in the art.

GAATGTCTTA GAM337037 is a novel bioinformatically detectable regulatory, non protein
AAATTCTAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337037 was detected
CAGTCTTTCT is described with additional reference to Figs. 9-15.

TCTTCTTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTATTAACA encoded by the human genome.

GCAATTAACT GAM337037 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTCTC GAM337037 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337037 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337037 precursor RNA is designated SEQ ID:6785, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6785 is located from position 66974964 to position 66975068 relative to chromosome 9 on the `+` strand.

GAM337037 precursor RNA folds onto itself, forming GAM337037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337037 precursor RNA, designated SEQ ID NO: 6785, and a schematic representation of a predicted secondary folding of GAM337037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337037 folded precursor RNA yielding a GAM337037 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337037 RNA, hereby incorporated herein.

GAM337037 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337037 target RNA, herein designated GAM TARGET RNA.

GAM337037 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337037 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337037 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337037 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337037 RNA, herein designated GAM RNA, to target binding sites on GAM337037 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337037 target RNA into GAM337037 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337037 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337037 target genes. The mRNA of each one of this plurality of GAM337037 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337037 RNA, herein designated GAM RNA, and which when bound by GAM337037 RNA causes inhibition of translation of the GAM337037 target mRNA into a corresponding GAM337037 target protein.

The mechanism of the translational inhibition exerted by GAM337037 RNA, herein designated GAM RNA, on one or more GAM337037 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337037 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337037 RNA, herein designated GAM RNA, of GAM337037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337037 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337037 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337037 RNA correlate with, and may be deduced from, the identity of the GAM337037 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337038 6707 GGAGAGGCAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTGAGGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAGGTGTCA Messenger 337038 (GAM337038) oligonucleotides modulates expression of respective target

GGAATGAAAG genes whose function and utility is known in the art.

AATGTCTTAA GAM337038 is a novel bioinformatically detectable regulatory, non protein

AATTCTAAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337038 was detected

AGTCTTTCTT is described with additional reference to Figs. 9-15.

CTTCTTCTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTATTAACAG encoded by the human genome.

CAATTAACTC GAM337038 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCT GAM337038 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337038 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337038 precursor RNA is designated SEQ ID:6707, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6707 is located from position 66974965 to position 66975067 relative to chromosome 9 on the `+` strand.

GAM337038 precursor RNA folds onto itself, forming GAM337038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337038 precursor RNA, designated SEQ ID NO: 6707, and a schematic representation of a predicted secondary folding of GAM337038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337038 folded precursor RNA yielding a GAM337038 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337038 RNA, hereby incorporated herein.

GAM337038 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337038 target RNA, herein designated GAM TARGET RNA.

GAM337038 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337038 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337038 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337038 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337038 RNA, herein designated GAM RNA, to target binding sites on GAM337038 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337038 target RNA into GAM337038 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337038 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337038 target genes. The mRNA of each one of this plurality of GAM337038 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337038 RNA, herein designated GAM RNA, and which when bound by GAM337038 RNA causes inhibition of translation of the GAM337038 target mRNA into a corresponding GAM337038 target protein.

The mechanism of the translational inhibition exerted by GAM337038 RNA, herein designated GAM RNA, on one or more GAM337038 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337038 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337038 RNA, herein designated GAM RNA, of GAM337038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337038 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337038 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337038 RNA correlate with, and may be deduced from, the identity of the GAM337038 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337039 6352 GAGAGGCATT Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGAGGGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGTCAG Messenger 337039 (GAM337039) oligonucleotides modulates expression of respective target
GAATGAAAGA genes whose function and utility is known in the art.

ATGTCTTAAA GAM337039 is a novel bioinformatically detectable regulatory, non protein
ATTCTAAGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337039 was detected
GTCTTTCTTC is described with additional reference to Figs. 9-15.

TTCTTCTCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TATTAACAGC encoded by the human genome.

AATTAACTCT GAM337039 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM337039 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337039 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337039 precursor RNA is designated SEQ ID:6352, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6352 is located from position 66974966 to position 66975066 relative to chromosome 9 on the `+` strand.

GAM337039 precursor RNA folds onto itself, forming GAM337039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337039 precursor RNA, designated SEQ ID NO: 6352, and a schematic representation of a predicted secondary folding of GAM337039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337039 folded precursor RNA yielding a GAM337039 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337039 RNA, hereby incorporated herein.

GAM337039 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337039 target RNA, herein designated GAM TARGET RNA.

GAM337039 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337039 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337039 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337039 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337039 RNA, herein designated GAM RNA, to target binding sites on GAM337039 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337039 target RNA into GAM337039 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337039 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337039 target genes. The mRNA of each one of this plurality of GAM337039 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337039 RNA, herein designated GAM RNA, and which when bound by GAM337039 RNA causes inhibition of translation of the GAM337039 target mRNA into a corresponding GAM337039 target protein.

The mechanism of the translational inhibition exerted by GAM337039 RNA, herein designated GAM RNA, on one or more GAM337039 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337039 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337039 RNA, herein designated GAM RNA, of GAM337039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337039 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337039 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337039 RNA correlate with, and may be deduced from, the identity of the GAM337039 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337041 7312 TTGCTTGAAC CCAAGAGGCG GAGGTTGCAG TGAGCTAAGA TCATGCCACT GCACTCCAGC CTGGGTGACA GAGCAA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337041 (GAM337041) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337041 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337041 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337041 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337041 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337041 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337041 precursor RNA is designated SEQ ID:7312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7312 is located from position 67244014 to position 67244089 relative to chromosome 17 on the `-` strand.

GAM337041 precursor RNA folds onto itself, forming GAM337041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337041 precursor RNA, designated SEQ ID NO: 7312, and a schematic representation of a predicted secondary folding of GAM337041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337041 folded precursor RNA yielding a GAM337041 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337041 RNA, hereby incorporated herein.

GAM337041 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337041 target RNA, herein designated GAM TARGET RNA.

GAM337041 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337041 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337041 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337041 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337041 RNA, herein designated GAM RNA, to target binding sites on GAM337041 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337041 target RNA into GAM337041 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337041 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337041 target genes. The mRNA of each one of this plurality of GAM337041 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337041 RNA, herein designated GAM RNA, and which when bound by GAM337041 RNA causes inhibition of translation of the GAM337041 target mRNA into a corresponding GAM337041 target protein.

The mechanism of the translational inhibition exerted by GAM337041 RNA, herein designated GAM RNA, on one or more GAM337041 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337041 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337041 RNA, herein designated GAM RNA, of GAM337041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337041 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337041 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337041 RNA correlate with, and may be deduced from, the identity of the GAM337041 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337042 6744 GGCCACCTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCCTATTCC detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGGCACTTC Messenger 337042 (GAM337042) oligonucleotides modulates expression of respective target
ATTCTTCTGA genes whose function and utility is known in the art.

TAATGGAGTA GAM337042 is a novel bioinformatically detectable regulatory, non protein
TGAGAGAGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337042 was detected
TGGGACATGA is described with additional reference to Figs. 9-15.

GGTGGACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337042 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337042 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337042 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337042 precursor RNA is designated SEQ ID:6744, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6744 is located from position 67268904 to position 67268981 relative to chromosome 16 on the `+` strand.

GAM337042 precursor RNA folds onto itself, forming GAM337042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337042 precursor RNA, designated SEQ ID NO: 6744, and a schematic representation of a predicted secondary folding of GAM337042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337042 folded precursor RNA yielding a GAM337042 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337042 RNA, hereby incorporated herein.

GAM337042 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337042 target RNA, herein designated GAM TARGET RNA.

GAM337042 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337042 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337042 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337042 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337042 RNA, herein designated GAM RNA, to target binding sites on GAM337042 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337042 target RNA into GAM337042 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337042 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337042 target genes. The mRNA of each one of this

plurality of GAM337042 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337042 RNA, herein designated GAM RNA, and which when bound by GAM337042 RNA causes inhibition of translation of the GAM337042 target mRNA into a corresponding GAM337042 target protein.

The mechanism of the translational inhibition exerted by GAM337042 RNA, herein designated GAM RNA, on one or more GAM337042 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337042 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337042 RNA, herein designated GAM RNA, of GAM337042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337042 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337042 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337042 RNA correlate with, and may be deduced from, the identity of the GAM337042 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337043 6878 GTCCCAAAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAGGAAAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAGCAAGGG Messenger 337043 (GAM337043) oligonucleotides modulates expression of respective target

CATGGTCCAT genes whose function and utility is known in the art.

CTGCTGCCTT GAM337043 is a novel bioinformatically detectable regulatory, non protein

TTCTGGGCTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337043 was detected

CCTTTTCTGC is described with additional reference to Figs. 9-15.

TGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337043 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337043 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337043 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337043 precursor RNA is designated SEQ ID:6878, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6878 is located from position 67274771 to position 67274844 relative to chromosome 11 on the `-` strand.

GAM337043 precursor RNA folds onto itself, forming GAM337043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337043 precursor RNA, designated SEQ ID NO: 6878, and a schematic representation of a predicted secondary folding of GAM337043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337043 folded precursor RNA yielding a GAM337043 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337043 RNA, hereby incorporated herein.

GAM337043 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337043 target RNA, herein designated GAM TARGET RNA.

GAM337043 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337043 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337043 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337043 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337043 RNA, herein designated GAM RNA, to target binding sites on GAM337043 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337043 target RNA into GAM337043 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337043 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337043 target genes. The mRNA of each one of this plurality of GAM337043 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337043 RNA, herein designated GAM RNA, and which when bound by GAM337043 RNA causes inhibition of translation of the GAM337043 target mRNA into a corresponding GAM337043 target protein.

The mechanism of the translational inhibition exerted by GAM337043 RNA, herein designated GAM RNA, on one or more GAM337043 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337043 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337043 RNA, herein designated GAM RNA, of GAM337043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337043 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337043 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337043 RNA correlate with, and may be deduced from, the identity of the GAM337043 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337045 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337045 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337045 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337045 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337045 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337045 precursor RNA is designated SEQ ID:5886, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5886 is located from position 67383500 to position 67383581 relative to chromosome 18 on the `-` strand.

GAM337045 precursor RNA folds onto itself, forming GAM337045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337045 precursor RNA, designated SEQ ID NO: 5886, and a schematic representation of a predicted secondary folding of GAM337045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337045 folded precursor RNA yielding a GAM337045 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337045 RNA, hereby incorporated herein.

GAM337045 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337045 target RNA, herein designated GAM TARGET RNA.

GAM337045 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337045 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337045 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337045 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337045 RNA, herein designated GAM RNA, to target binding sites on GAM337045 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337045 target RNA into GAM337045 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337045 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337045 target genes. The mRNA of each one of this plurality of GAM337045 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337045 RNA, herein designated GAM RNA, and which when bound by GAM337045 RNA causes inhibition of translation of the GAM337045 target mRNA into a corresponding GAM337045 target protein.

The mechanism of the translational inhibition exerted by GAM337045 RNA, herein designated GAM RNA, on one or more GAM337045 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337045 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337045 RNA, herein designated GAM RNA, of GAM337045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337045 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337045 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337045 RNA correlate with, and may be deduced from, the identity of the GAM337045 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337046 6274 CTTTGTGAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTTTGAAA detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGTAATGAG Messenger 337046 (GAM337046) oligonucleotides modulates expression of respective target

CGCAGTTTAC genes whose function and utility is known in the art.

TGAGTCATTA GAM337046 is a novel bioinformatically detectable regulatory, non protein
CTAGTCTCGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337046 was detected
CCCATTCGTA is described with additional reference to Figs. 9-15.

GAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337046 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337046 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337046 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337046 precursor RNA is designated SEQ ID:6274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6274 is located from position 67560293 to position 67560365 relative to chromosome 8 on the `-` strand.

GAM337046 precursor RNA folds onto itself, forming GAM337046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337046 precursor RNA, designated SEQ ID NO: 6274, and a schematic representation of a predicted secondary folding of GAM337046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337046 folded precursor RNA yielding a GAM337046 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337046 RNA, hereby incorporated herein.

GAM337046 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337046 target RNA, herein designated GAM TARGET RNA.

GAM337046 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337046 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337046 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337046 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337046 RNA, herein designated GAM RNA, to target binding sites on GAM337046 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337046 target RNA into GAM337046 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337046 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337046 target genes. The mRNA of each one of this plurality of GAM337046 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337046 RNA, herein designated GAM RNA, and which when bound by GAM337046 RNA causes inhibition of translation of the GAM337046 target mRNA into a corresponding GAM337046 target protein.

The mechanism of the translational inhibition exerted by GAM337046 RNA, herein designated GAM RNA, on one or more GAM337046 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337046 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337046 RNA, herein designated GAM RNA, of GAM337046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337046 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337046 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337046 RNA correlate with, and may be deduced from, the identity of the GAM337046 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337047 6944 GTTTGGAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically
CTGTTGCTTC detected oligonucleotides of the present invention, referred to here as Genomic Address
CTTGAGGCAC Messenger 337047 (GAM337047) oligonucleotides modulates expression of respective target
GGTAAGGAGT genes whose function and utility is known in the art.

GGTTCCAATT GAM337047 is a novel bioinformatically detectable regulatory, non protein
TGGGGTGCTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337047 was detected
ACGGGATCCA is described with additional reference to Figs. 9-15.

CAGATCTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTTCTTTCC encoded by the human genome.

TCTGCCTCCC GAM337047 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CATCTCCTGA GAM337047 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
T GAM337047 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337047 precursor RNA is designated SEQ ID:6944, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6944 is located from position 67697723 to position 67697833 relative to chromosome 12 on the `+` strand.

GAM337047 precursor RNA folds onto itself, forming GAM337047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337047 precursor RNA, designated SEQ ID NO: 6944, and a schematic representation of a predicted secondary folding of GAM337047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337047 folded precursor RNA yielding a GAM337047 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337047 RNA, hereby incorporated herein.

GAM337047 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337047 target RNA, herein designated GAM TARGET RNA.

GAM337047 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337047 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337047 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337047 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337047 RNA, herein designated GAM RNA, to target binding sites on GAM337047 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337047 target RNA into GAM337047 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337047 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337047 target genes. The mRNA of each one of this plurality of GAM337047 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337047 RNA, herein designated GAM RNA, and which when bound by GAM337047 RNA causes inhibition of translation of the GAM337047 target mRNA into a corresponding GAM337047 target protein.

The mechanism of the translational inhibition exerted by GAM337047 RNA, herein designated GAM RNA, on one or more GAM337047 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337047 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337047 RNA, herein designated GAM RNA, of GAM337047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337047 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337047 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337047 RNA correlate with, and may be deduced from, the identity of the GAM337047 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337051 6351 GAGAGAGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGAGAGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TCGGCTGGGG Messenger 337051 (GAM337051) oligonucleotides modulates expression of respective target
CGAGTGTGGA genes whose function and utility is known in the art.

CCGCAGCCCA GAM337051 is a novel bioinformatically detectable regulatory, non protein
GAGTTAGTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337051 was detected
TGGCTGCAGT is described with additional reference to Figs. 9-15.

GCAACTCTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTAAAATGTT encoded by the human genome.

ATTCTCACGC GAM337051 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CCTTTCTT GAM337051 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337051 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337051 precursor RNA is designated SEQ ID:6351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6351 is located from position 68096932 to position 68097039 relative to chromosome 9 on the `+` strand.

GAM337051 precursor RNA folds onto itself, forming GAM337051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337051 precursor RNA, designated SEQ ID NO: 6351, and a schematic representation of a predicted secondary folding of GAM337051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337051 folded precursor

RNA yielding a GAM337051 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337051 RNA, hereby incorporated herein.

GAM337051 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337051 target RNA, herein designated GAM TARGET RNA.

GAM337051 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337051 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337051 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337051 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337051 RNA, herein designated GAM RNA, to target binding sites on GAM337051 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337051 target RNA into GAM337051 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337051 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337051 target genes. The mRNA of each one of this plurality of GAM337051 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337051 RNA, herein designated GAM RNA, and which when bound by GAM337051 RNA causes inhibition of translation of the GAM337051 target mRNA into a corresponding GAM337051 target protein.

The mechanism of the translational inhibition exerted by GAM337051 RNA, herein designated GAM RNA, on one or more GAM337051 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337051 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337051 RNA, herein designated GAM RNA, of GAM337051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337051 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337051 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337051 RNA correlate with, and may be deduced from, the identity of the GAM337051 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337052 5725 AGAGAGGAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAGAGGAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CGGCTGGGGC Messenger 337052 (GAM337052) oligonucleotides modulates expression of respective target

GAGTGTGGAC genes whose function and utility is known in the art.

CGCAGCCCAG GAM337052 is a novel bioinformatically detectable regulatory, non protein

AGTTAGTCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337052 was detected

GGCTGCAGTG is described with additional reference to Figs. 9-15.

CAACTCTTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAAAATGTTA encoded by the human genome.

TTCTCACGCC GAM337052 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTTTCT GAM337052 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337052 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337052 precursor RNA is designated SEQ ID:5725, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5725 is located from position 68096933 to position 68097038 relative to chromosome 9 on the `+` strand.

GAM337052 precursor RNA folds onto itself, forming GAM337052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337052 precursor RNA, designated SEQ ID NO: 5725, and a schematic representation of a predicted secondary folding of GAM337052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337052 folded precursor RNA yielding a GAM337052 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337052 RNA, hereby incorporated herein.

GAM337052 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337052 target RNA, herein designated GAM TARGET RNA.

GAM337052 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337052 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337052 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337052 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337052 RNA, herein designated GAM RNA, to target binding sites on GAM337052 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337052 target RNA into GAM337052 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337052 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337052 target genes. The mRNA of each one of this plurality of GAM337052 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337052 RNA, herein designated GAM RNA, and which when bound by GAM337052 RNA causes inhibition of translation of the GAM337052 target mRNA into a corresponding GAM337052 target protein.

The mechanism of the translational inhibition exerted by GAM337052 RNA, herein designated GAM RNA, on one or more GAM337052 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337052 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337052 RNA, herein designated GAM RNA, of GAM337052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337052 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337052 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337052 RNA correlate with, and may be deduced from, the identity of the GAM337052 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337053 6743 GGCATTAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCAGTCACA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCAAGCAAG Messenger 337053 (GAM337053) oligonucleotides modulates expression of respective target

TGTGGACAGT genes whose function and utility is known in the art.

GAGTAATGTC GAM337053 is a novel bioinformatically detectable regulatory, non protein

TGAAGATTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337053 was detected

ATAGCTTGAT is described with additional reference to Figs. 9-15.

CACAGCTACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTGTCCTGC encoded by the human genome.

TGTCTGAACT GAM337053 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CCATTGTC GAM337053 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337053 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337053 precursor RNA is designated SEQ ID:6743, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6743 is located from position 68550580 to position 68550687

relative to chromosome 12 on the `-` strand.

GAM337053 precursor RNA folds onto itself, forming GAM337053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337053 precursor RNA, designated SEQ ID NO: 6743, and a schematic representation of a predicted secondary folding of GAM337053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337053 folded precursor RNA yielding a GAM337053 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337053 RNA, hereby incorporated herein.

GAM337053 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337053 target RNA, herein designated GAM TARGET RNA.

GAM337053 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337053 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337053 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337053 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337053 RNA, herein designated GAM RNA, to target binding sites on GAM337053 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337053 target RNA into GAM337053 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337053 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337053 target genes. The mRNA of each one of this plurality of GAM337053 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337053 RNA, herein designated GAM RNA, and which when bound by GAM337053 RNA causes inhibition of translation of the GAM337053 target mRNA into a corresponding GAM337053 target protein.

The mechanism of the translational inhibition exerted by GAM337053 RNA, herein designated GAM RNA, on one or more GAM337053 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337053 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337053 RNA, herein designated GAM RNA, of GAM337053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337053 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337053 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337053 RNA correlate with, and may be deduced from, the identity of the GAM337053 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337055 7293 TTCAGGTACT Fig. 8 further provides a conceptual description of another novel bioinformatically
CCATGTGATA detected oligonucleotides of the present invention, referred to here as Genomic Address
TATGGTTCCA Messenger 337055 (GAM337055) oligonucleotides modulates expression of respective target
CAATCCTCAG genes whose function and utility is known in the art.

CGTGTTAACT GAM337055 is a novel bioinformatically detectable regulatory, non protein
GAAGCCTTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337055 was detected
TGAGTTTAAC is described with additional reference to Figs. 9-15.

AAAGCTGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGAAGATCT encoded by the human genome.

GGGGAAAGTG GAM337055 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAGAAGTTGC GAM337055 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

AACAGAGTTT GAM337055 precursor RNA does not encode a protein. A nucleotide sequence identical or

TGGG highly similar to the nucleotide sequence of GAM337055 precursor RNA is designated SEQ ID:7293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7293 is located from position 68796420 to position 68796543 relative to chromosome 12 on the `-` strand.

GAM337055 precursor RNA folds onto itself, forming GAM337055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337055 precursor RNA, designated SEQ ID NO: 7293, and a schematic representation of a predicted secondary folding of GAM337055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337055 folded precursor RNA yielding a GAM337055 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337055 RNA, hereby incorporated herein.

GAM337055 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337055 target RNA, herein designated GAM TARGET RNA.

GAM337055 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337055 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337055 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337055 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337055 RNA, herein designated GAM RNA, to target binding sites on GAM337055 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337055 target RNA into GAM337055 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337055 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337055 target genes. The mRNA of each one of this plurality of GAM337055 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337055 RNA, herein designated GAM RNA, and which when bound by GAM337055 RNA causes inhibition of translation of the GAM337055 target mRNA into a corresponding GAM337055 target protein.

The mechanism of the translational inhibition exerted by GAM337055 RNA, herein designated GAM RNA, on one or more GAM337055 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337055 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337055 RNA, herein designated GAM RNA, of GAM337055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337055 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337055 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337055 RNA correlate with, and may be deduced from, the identity of the GAM337055 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337056 6027 CAGGTACTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGTGATATA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGGTTCCACA Messenger 337056 (GAM337056) oligonucleotides modulates expression of respective target

ATCCTCAGCG genes whose function and utility is known in the art.

TGTTAACTGA GAM337056 is a novel bioinformatically detectable regulatory, non protein
AGCCTTGTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337056 was detected
AGTTTAACAA is described with additional reference to Figs. 9-15.

AGCTGCCATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAAGATCTGG encoded by the human genome.

GGAAAGTGAA GAM337056 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAAGTTGCAA GAM337056 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CAGAGTTTTG GAM337056 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337056 precursor RNA is designated SEQ ID:6027, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6027 is located from position 68796422 to position 68796541 relative to chromosome 12 on the `-` strand.

GAM337056 precursor RNA folds onto itself, forming GAM337056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337056 precursor RNA, designated SEQ ID NO: 6027, and a schematic representation of a predicted secondary folding of GAM337056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337056 folded precursor RNA yielding a GAM337056 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337056 RNA, hereby incorporated herein.

GAM337056 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337056 target RNA, herein designated GAM TARGET RNA.

GAM337056 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337056 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337056 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337056 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337056 RNA, herein designated GAM RNA, to target binding sites on GAM337056 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337056 target RNA into GAM337056 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337056 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337056 target genes. The mRNA of each one of this plurality of GAM337056 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337056 RNA, herein designated GAM RNA, and which when bound by GAM337056 RNA causes inhibition of translation of the GAM337056 target mRNA into a corresponding GAM337056 target protein.

The mechanism of the translational inhibition exerted by GAM337056 RNA, herein designated GAM RNA, on one or more GAM337056 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337056 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337056 RNA, herein designated GAM RNA, of GAM337056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337056 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337056 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337056 RNA correlate with, and may be deduced from, the identity of the GAM337056 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337057 5992 CACAATCCTC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGCGTGTTAA detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGAAGCCTT Messenger 337057 (GAM337057) oligonucleotides modulates expression of respective target
GTTGAGTTTA genes whose function and utility is known in the art.

ACAAAGCTGC GAM337057 is a novel bioinformatically detectable regulatory, non protein
CATTGAAGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337057 was detected
CTGGGGAAAG is described with additional reference to Figs. 9-15.

TG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337057 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337057 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337057 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337057 precursor RNA is designated SEQ ID:5992, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5992 is located from position 68796444 to position 68796515 relative to chromosome 12 on the `-` strand.

GAM337057 precursor RNA folds onto itself, forming GAM337057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337057 precursor RNA, designated SEQ ID NO: 5992, and a schematic representation of a predicted secondary folding of GAM337057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337057 folded precursor RNA yielding a GAM337057 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337057 RNA, hereby incorporated herein.

GAM337057 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337057 target RNA, herein designated GAM TARGET RNA.

GAM337057 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337057 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337057 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337057 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337057 RNA, herein designated GAM RNA, to target binding sites on GAM337057 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337057 target RNA into GAM337057 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337057 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337057 target genes. The mRNA of each one of this plurality of GAM337057 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337057 RNA, herein designated GAM RNA, and which when bound by GAM337057 RNA causes inhibition of translation of the GAM337057 target mRNA into a corresponding GAM337057 target protein.

The mechanism of the translational inhibition exerted by GAM337057 RNA, herein designated GAM RNA, on one or more GAM337057 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337057 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337057 RNA, herein designated GAM RNA, of GAM337057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337057 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337057 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337057 RNA correlate with, and may be deduced from, the identity of the GAM337057 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337058 7037 TCCTCAGCGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTTAACTGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCTTGTTGA Messenger 337058 (GAM337058) oligonucleotides modulates expression of respective target

GTTTAACAAA genes whose function and utility is known in the art.

GCTGCCATTG GAM337058 is a novel bioinformatically detectable regulatory, non protein

AAGATCTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337058 was detected

GA is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337058 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337058 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337058 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337058 precursor RNA is designated SEQ ID:7037, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7037 is located from position 68796449 to position 68796510 relative to chromosome 12 on the `-` strand.

GAM337058 precursor RNA folds onto itself, forming GAM337058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337058 precursor RNA, designated SEQ ID NO: 7037, and a schematic representation of a predicted secondary folding of GAM337058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337058 folded precursor RNA yielding a GAM337058 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337058 RNA, hereby incorporated herein.

GAM337058 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337058 target RNA, herein designated GAM TARGET RNA.

GAM337058 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337058 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337058 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337058 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337058 RNA, herein designated GAM RNA, to target binding sites on GAM337058 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337058 target RNA into GAM337058 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337058 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337058 target genes. The mRNA of each one of this plurality of GAM337058 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337058 RNA, herein designated GAM RNA, and which when bound by GAM337058 RNA causes inhibition of translation of the GAM337058 target mRNA into a corresponding GAM337058 target protein.

The mechanism of the translational inhibition exerted by GAM337058 RNA, herein designated GAM RNA, on one or more GAM337058 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337058 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337058 RNA, herein designated GAM RNA, of GAM337058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337058 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337058 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337058 RNA correlate with, and may be deduced from, the identity of the GAM337058 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCTCAGCTTC Messenger 337059 (GAM337059) oligonucleotides modulates expression of respective target
CCAAAGTGCT genes whose function and utility is known in the art.

GGGATTACAG GAM337059 is a novel bioinformatically detectable regulatory, non protein
GCATGATCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337059 was detected
CCACGCCTGG is described with additional reference to Figs. 9-15.

TCCCATTGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTTACATCT encoded by the human genome.

GATGGGCTGC GAM337059 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TTTTGGGTTG GAM337059 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337059 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337059 precursor RNA is designated SEQ ID:6016, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6016 is located from position 68875043 to position 68875152 relative to chromosome 12 on the `+` strand.

GAM337059 precursor RNA folds onto itself, forming GAM337059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337059 precursor RNA, designated SEQ ID NO: 6016, and a schematic representation of a predicted secondary folding of GAM337059 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337059 folded precursor RNA yielding a GAM337059 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337059 RNA, hereby incorporated herein.

GAM337059 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337059 target RNA, herein designated GAM TARGET RNA.

GAM337059 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337059 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337059 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337059 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337059 RNA, herein designated GAM RNA, to target binding sites on GAM337059 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337059 target RNA into GAM337059 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337059 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337059 target genes. The mRNA of each one of this plurality of GAM337059 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337059 RNA, herein designated GAM RNA, and which when bound by GAM337059 RNA causes inhibition of translation of the GAM337059 target mRNA into a corresponding GAM337059 target protein.

The mechanism of the translational inhibition exerted by GAM337059 RNA, herein designated GAM RNA, on one or more GAM337059 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337059 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337059 RNA, herein designated GAM RNA, of GAM337059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337059 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337059 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337059 RNA correlate with, and may be deduced from, the identity of the GAM337059 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337060 7114 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAAGGC Messenger 337060 (GAM337060) oligonucleotides modulates expression of respective target

AGAGGTTGCA genes whose function and utility is known in the art.

GTCAGCAGAT GAM337060 is a novel bioinformatically detectable regulatory, non protein

ATTGCACCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337060 was detected

TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAAGCAAGAC encoded by the human genome.

TCTGCCTCA GAM337060 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337060 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337060 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337060 precursor RNA is designated SEQ ID:7114, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7114 is located from position 69076604 to position 69076702 relative to chromosome 5 on the `-` strand.

GAM337060 precursor RNA folds onto itself, forming GAM337060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337060 precursor RNA, designated SEQ ID NO: 7114, and a schematic representation of a predicted secondary folding of GAM337060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337060 folded precursor RNA yielding a GAM337060 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337060 RNA, hereby incorporated herein. Expression of GAM337060 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337060 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337060 target RNA, herein designated GAM TARGET RNA.

GAM337060 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337060 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337060 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337060 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337060 RNA, herein designated GAM RNA, to target binding sites on GAM337060 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337060 target RNA into GAM337060 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337060 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337060 target genes. The mRNA of each one of this plurality of GAM337060 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337060 RNA,

herein designated GAM RNA, and which when bound by GAM337060 RNA causes inhibition of translation of the GAM337060 target mRNA into a corresponding GAM337060 target protein.

The mechanism of the translational inhibition exerted by GAM337060 RNA, herein designated GAM RNA, on one or more GAM337060 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337060 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337060 RNA, herein designated GAM RNA, of GAM337060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337060 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337060 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337060 RNA correlate with, and may be deduced from, the identity of the GAM337060 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337061 6131 CCTTTGAACA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGGAACTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGAAAGAAA Messenger 337061 (GAM337061) oligonucleotides modulates expression of respective target

TGGGATCTGT genes whose function and utility is known in the art.

GCAGCTACTT GAM337061 is a novel bioinformatically detectable regulatory, non protein

CAGTTAGCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337061 was detected

GAATCCTACA is described with additional reference to Figs. 9-15.

GTTCTGGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTTCTTTAAT encoded by the human genome.

GCTAGTTTTC GAM337061 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CCTTTTCAGA GAM337061 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GG GAM337061 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337061 precursor RNA is designated SEQ ID:6131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6131 is located from position 69104781 to position 69104892 relative to chromosome 9 on the `+` strand.

GAM337061 precursor RNA folds onto itself, forming GAM337061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337061 precursor RNA, designated SEQ ID NO: 6131, and a schematic representation of a predicted secondary folding of GAM337061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337061 folded precursor RNA yielding a GAM337061 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337061 RNA, hereby incorporated herein.

GAM337061 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337061 target RNA, herein designated GAM TARGET RNA.

GAM337061 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337061 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337061 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337061 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337061 RNA, herein designated GAM RNA, to target binding sites on GAM337061 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337061 target RNA

into GAM337061 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337061 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337061 target genes. The mRNA of each one of this plurality of GAM337061 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337061 RNA, herein designated GAM RNA, and which when bound by GAM337061 RNA causes inhibition of translation of the GAM337061 target mRNA into a corresponding GAM337061 target protein.

The mechanism of the translational inhibition exerted by GAM337061 RNA, herein designated GAM RNA, on one or more GAM337061 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337061 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337061 RNA, herein designated GAM RNA, of GAM337061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337061 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337061 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337061 RNA correlate with, and may be deduced from, the identity of the GAM337061 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337062 6636 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 337062 (GAM337062) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGGTCAC GAM337062 is a novel bioinformatically detectable regulatory, non protein

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337062 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM337062 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337062 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337062 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337062 precursor RNA is designated SEQ ID:6636, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6636 is located from position 69278504 to position 69278591 relative to chromosome 5 on the `+` strand.

GAM337062 precursor RNA folds onto itself, forming GAM337062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337062 precursor RNA, designated SEQ ID NO: 6636, and a schematic representation of a predicted secondary folding of GAM337062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337062 folded precursor RNA yielding a GAM337062 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337062 RNA, hereby incorporated herein. Expression of GAM337062 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337062 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337062 target RNA, herein designated GAM TARGET RNA.

GAM337062 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337062 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337062 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337062 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337062 RNA, herein designated GAM RNA, to target binding sites on GAM337062 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337062 target RNA into GAM337062 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337062 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337062 target genes. The mRNA of each one of this plurality of GAM337062 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337062 RNA, herein designated GAM RNA, and which when bound by GAM337062 RNA causes inhibition of translation of the GAM337062 target mRNA into a corresponding GAM337062 target protein.

The mechanism of the translational inhibition exerted by GAM337062 RNA, herein designated GAM RNA, on one or more GAM337062 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337062 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337062 RNA, herein designated GAM RNA, of GAM337062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337062 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337062 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337062 RNA correlate with, and may be deduced from, the identity of the GAM337062 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337063 6186 CTCTTGACCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGTTCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

AATGAGGGAC Messenger 337063 (GAM337063) oligonucleotides modulates expression of respective target

ATTTTACCTG genes whose function and utility is known in the art.

CCGGGGACAT GAM337063 is a novel bioinformatically detectable regulatory, non protein
TTCCAATGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337063 was detected

TGGGGACACT is described with additional reference to Figs. 9-15.

TTTGGTTATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AG encoded by the human genome.

GAM337063 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337063 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337063 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337063 precursor RNA is designated SEQ ID:6186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6186 is located from position 69410140 to position 69410221 relative to chromosome 5 on the `+` strand.

GAM337063 precursor RNA folds onto itself, forming GAM337063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337063 precursor RNA, designated SEQ ID NO: 6186, and a schematic representation of a predicted secondary folding of GAM337063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337063 folded precursor RNA yielding a GAM337063 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM337063 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337063 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM337063 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337063 target RNA, herein designated GAM TARGET RNA.

GAM337063 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337063 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337063 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337063 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337063 RNA, herein designated GAM RNA, to target binding sites on GAM337063 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337063 target RNA into GAM337063 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337063 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337063 target genes. The mRNA of each one of this plurality of GAM337063 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337063 RNA, herein designated GAM RNA, and which when bound by GAM337063 RNA causes inhibition of translation of the GAM337063 target mRNA into a corresponding GAM337063 target protein.

The mechanism of the translational inhibition exerted by GAM337063 RNA, herein designated GAM RNA, on one or more GAM337063 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337063 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337063 RNA, herein designated GAM RNA, of GAM337063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337063 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337063 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337063 RNA correlate with, and may be deduced from, the identity of the GAM337063 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337064 6637 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 337064 (GAM337064) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGGTCAC GAM337064 is a novel bioinformatically detectable regulatory, non protein
ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337064 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM337064 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337064 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337064 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337064 precursor RNA is designated SEQ ID:6637, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6637 is located from position 69429920 to position 69430007 relative to chromosome 5 on the `-` strand.

GAM337064 precursor RNA folds onto itself, forming GAM337064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337064 precursor RNA, designated SEQ ID NO: 6637, and a schematic representation of a predicted secondary folding of GAM337064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337064 folded precursor RNA yielding a GAM337064 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337064 RNA, hereby incorporated herein. Expression of GAM337064 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337064 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337064 target RNA, herein designated GAM TARGET RNA.

GAM337064 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337064 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337064 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337064 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337064 RNA, herein designated GAM RNA, to target binding sites on GAM337064 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337064 target RNA into GAM337064 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337064 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337064 target genes. The mRNA of each one of this plurality of GAM337064 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337064 RNA, herein designated GAM RNA, and which when bound by GAM337064 RNA causes inhibition of translation of the GAM337064 target mRNA into a corresponding GAM337064 target protein.

The mechanism of the translational inhibition exerted by GAM337064 RNA, herein designated GAM RNA, on one or more GAM337064 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337064 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337064 RNA, herein designated GAM RNA, of GAM337064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337064 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337064 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337064 RNA correlate with, and may be deduced from, the identity of the GAM337064 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337066 7291 TTCACTCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCTGGCAGA Messenger 337066 (GAM337066) oligonucleotides modulates expression of respective target
TTCCGGTGGA genes whose function and utility is known in the art.

TTATGCAAAG GAM337066 is a novel bioinformatically detectable regulatory, non protein
AGGGACTGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337066 was detected
AGAGAATCTG is described with additional reference to Figs. 9-15.

AGCTGTTGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGACTTCTGA encoded by the human genome.

A GAM337066 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337066 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337066 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337066 precursor RNA is designated SEQ ID:7291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7291 is located from position 69498130 to position 69498220 relative to chromosome 11 on the `-` strand.

GAM337066 precursor RNA folds onto itself, forming GAM337066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337066 precursor RNA, designated SEQ ID NO: 7291, and a schematic representation of a predicted secondary folding of GAM337066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337066 folded precursor RNA yielding a GAM337066 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337066 RNA, hereby incorporated herein.

GAM337066 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337066 target RNA, herein designated GAM TARGET RNA.

GAM337066 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337066 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337066 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337066 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337066 RNA, herein designated GAM RNA, to target binding sites on GAM337066 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337066 target RNA into GAM337066 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337066 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337066 target genes. The mRNA of each one of this plurality of GAM337066 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337066 RNA, herein designated GAM RNA, and which when bound by GAM337066 RNA causes inhibition of translation of the GAM337066 target mRNA into a corresponding GAM337066 target protein.

The mechanism of the translational inhibition exerted by GAM337066 RNA, herein designated GAM RNA, on one or more GAM337066 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337066 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337066 RNA, herein designated GAM RNA, of GAM337066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337066 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337066 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337066 RNA correlate with, and may be deduced from, the identity of the GAM337066 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337068 6279 GAAAAGGGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GATCAGTATT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCTGATCCT Messenger 337068 (GAM337068) oligonucleotides modulates expression of respective target

AGTTCAGTGC genes whose function and utility is known in the art.

TAGTCAGGGA GAM337068 is a novel bioinformatically detectable regulatory, non protein

GACTGTCAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337068 was detected

AAAGACCTTT is described with additional reference to Figs. 9-15.

TT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337068 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337068 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337068 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337068 precursor RNA is designated SEQ ID:6279, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6279 is located from position 69692764 to position 69692835 relative to chromosome 16 on the `+` strand.

GAM337068 precursor RNA folds onto itself, forming GAM337068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337068 precursor RNA, designated SEQ ID NO: 6279, and a schematic representation of a predicted secondary folding of GAM337068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337068 folded precursor RNA yielding a GAM337068 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337068 RNA, hereby incorporated herein.

GAM337068 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337068 target RNA, herein designated GAM TARGET RNA.

GAM337068 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337068 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337068 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337068 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337068 RNA, herein designated GAM RNA, to target binding sites on GAM337068 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337068 target RNA into GAM337068 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337068 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337068 target genes. The mRNA of each one of this plurality of GAM337068 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337068 RNA, herein designated GAM RNA, and which when bound by GAM337068 RNA causes inhibition of translation of the GAM337068 target mRNA into a corresponding GAM337068 target protein.

The mechanism of the translational inhibition exerted by GAM337068 RNA, herein designated GAM RNA, on one or more GAM337068 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337068 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337068 RNA, herein designated GAM RNA, of GAM337068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337068 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337068 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337068 RNA correlate with, and may be deduced from, the identity of the GAM337068 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337069 7115 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAAGGC Messenger 337069 (GAM337069) oligonucleotides modulates expression of respective target

AGAGGTTGCA genes whose function and utility is known in the art.

GTCAGCAGAT GAM337069 is a novel bioinformatically detectable regulatory, non protein

ATTGCACCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337069 was detected

TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAAGCAAGAC encoded by the human genome.

TCTGCCTCA GAM337069 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337069 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337069 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337069 precursor RNA is designated SEQ

ID:7115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7115 is located from position 69818313 to position 69818411 relative to chromosome 5 on the `+` strand.

GAM337069 precursor RNA folds onto itself, forming GAM337069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337069 precursor RNA, designated SEQ ID NO: 7115, and a schematic representation of a predicted secondary folding of GAM337069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337069 folded precursor RNA yielding a GAM337069 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337069 RNA, hereby incorporated herein. Expression of GAM337069 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337069 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337069 target RNA, herein designated GAM TARGET RNA.

GAM337069 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337069 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337069 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337069 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337069 RNA, herein designated GAM RNA, to target binding sites on GAM337069 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337069 target RNA

into GAM337069 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337069 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337069 target genes. The mRNA of each one of this plurality of GAM337069 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337069 RNA, herein designated GAM RNA, and which when bound by GAM337069 RNA causes inhibition of translation of the GAM337069 target mRNA into a corresponding GAM337069 target protein.

The mechanism of the translational inhibition exerted by GAM337069 RNA, herein designated GAM RNA, on one or more GAM337069 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337069 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337069 RNA, herein designated GAM RNA, of GAM337069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337069 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337069 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337069 RNA correlate with, and may be deduced from, the identity of the GAM337069 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337070 6377 GAGGCAGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAAGGCA Messenger 337070 (GAM337070) oligonucleotides modulates expression of respective target

GAGGTTGCAG genes whose function and utility is known in the art.

TCAGCAGATA GAM337070 is a novel bioinformatically detectable regulatory, non protein

TTGCACCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337070 was detected

GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGCAAGACT encoded by the human genome.

CTGCCTC GAM337070 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337070 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337070 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337070 precursor RNA is designated SEQ ID:6377, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6377 is located from position 69818314 to position 69818410 relative to chromosome 5 on the `+` strand.

GAM337070 precursor RNA folds onto itself, forming GAM337070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337070 precursor RNA, designated SEQ ID NO: 6377, and a schematic representation of a predicted secondary folding of GAM337070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337070 folded precursor RNA yielding a GAM337070 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337070 RNA, hereby incorporated herein. Expression of GAM337070 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337070 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337070 target RNA, herein designated GAM TARGET RNA.

GAM337070 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337070 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337070 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337070 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337070 RNA, herein designated GAM RNA, to target binding sites on GAM337070 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337070 target RNA into GAM337070 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337070 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337070 target genes. The mRNA of each one of this plurality of GAM337070 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337070 RNA, herein designated GAM RNA, and which when bound by GAM337070 RNA causes inhibition of translation of the GAM337070 target mRNA into a corresponding GAM337070 target protein.

The mechanism of the translational inhibition exerted by GAM337070 RNA, herein designated GAM RNA, on one or more GAM337070 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337070 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337070 RNA, herein designated GAM RNA, of GAM337070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337070 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337070 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337070 RNA correlate with, and may be deduced from, the identity of the GAM337070 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337071 5780 AGGCTGAGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTGGTGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
ATCTCGGCTC Messenger 337071 (GAM337071) oligonucleotides modulates expression of respective target
ACTGCAAGCT genes whose function and utility is known in the art.

CTGCCTCCCA GAM337071 is a novel bioinformatically detectable regulatory, non protein
GGTTCACGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337071 was detected
ATTGTCCTGC is described with additional reference to Figs. 9-15.

CTCAGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337071 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337071 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337071 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337071 precursor RNA is designated SEQ ID:5780, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5780 is located from position 69991881 to position 69991958 relative to chromosome 10 on the `+` strand.

GAM337071 precursor RNA folds onto itself, forming GAM337071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337071 precursor RNA, designated SEQ ID NO: 5780, and a schematic representation of a predicted secondary folding of GAM337071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337071 folded precursor RNA yielding a GAM337071 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337071 RNA, hereby incorporated herein.

GAM337071 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337071 target RNA, herein designated GAM TARGET RNA.

GAM337071 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337071 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337071 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337071 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337071 RNA, herein designated GAM RNA, to target binding sites on GAM337071 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337071 target RNA into GAM337071 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337071 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337071 target genes. The mRNA of each one of this plurality of GAM337071 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337071 RNA, herein designated GAM RNA, and which when bound by GAM337071 RNA causes inhibition of translation of the GAM337071 target mRNA into a corresponding GAM337071 target protein.

The mechanism of the translational inhibition exerted by GAM337071 RNA, herein designated GAM RNA, on one or more GAM337071 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337071 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337071 RNA, herein designated GAM RNA, of GAM337071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337071 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337071 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337071

RNA correlate with, and may be deduced from, the identity of the GAM337071 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337074 7099 TGAGACAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCGGGAG Messenger 337074 (GAM337074) oligonucleotides modulates expression of respective target
GTGGAGGTTA genes whose function and utility is known in the art.

CGGTGAGTGA GAM337074 is a novel bioinformatically detectable regulatory, non protein
GATCGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337074 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGCGAA encoded by the human genome.

ACTCCGTCTC GAM337074 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM337074 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337074 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337074 precursor RNA is designated SEQ ID:7099, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7099 is located from position 70140212 to position 70140312 relative to chromosome 16 on the `+` strand.

GAM337074 precursor RNA folds onto itself, forming GAM337074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337074 precursor RNA, designated SEQ ID NO: 7099, and a schematic representation of a predicted secondary folding of GAM337074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337074 folded precursor RNA yielding a GAM337074 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337074 RNA, hereby incorporated herein. Expression of GAM337074 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337074 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337074 target RNA, herein designated GAM TARGET RNA.

GAM337074 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337074 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337074 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337074 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337074 RNA, herein designated GAM RNA, to target binding sites on GAM337074 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337074 target RNA into GAM337074 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337074 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337074 target genes. The mRNA of each one of this plurality of GAM337074 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337074 RNA, herein designated GAM RNA, and which when bound by GAM337074 RNA causes inhibition of translation of the GAM337074 target mRNA into a corresponding GAM337074 target protein.

The mechanism of the translational inhibition exerted by GAM337074 RNA, herein designated GAM RNA, on one or more GAM337074 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337074 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337074 RNA, herein designated GAM RNA, of GAM337074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337074 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337074 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337074 RNA correlate with, and may be deduced from, the identity of the GAM337074 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337075 6343 GAGACAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCGGGAGG Messenger 337075 (GAM337075) oligonucleotides modulates expression of respective target
TGGAGGTTAC genes whose function and utility is known in the art.

GGTGAGTGAG GAM337075 is a novel bioinformatically detectable regulatory, non protein
ATCGCGCCAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337075 was detected
TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGAGCGAAA encoded by the human genome.

CTCCGTCTC GAM337075 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337075 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337075 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337075 precursor RNA is designated SEQ ID:6343, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6343 is located from position 70140213 to position 70140311 relative to chromosome 16 on the `+` strand.

GAM337075 precursor RNA folds onto itself, forming GAM337075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337075 precursor RNA, designated SEQ ID NO: 6343, and a schematic representation of a predicted secondary folding of GAM337075 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337075 folded precursor RNA yielding a GAM337075 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337075 RNA, hereby incorporated herein. Expression of GAM337075 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337075 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337075 target RNA, herein designated GAM TARGET RNA.

GAM337075 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337075 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337075 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337075 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337075 RNA, herein designated GAM RNA, to target binding sites on GAM337075 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337075 target RNA into GAM337075 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337075 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337075 target genes. The mRNA of each one of this plurality of GAM337075 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337075 RNA, herein designated GAM RNA, and which when bound by GAM337075 RNA causes inhibition of translation of the GAM337075 target mRNA into a corresponding GAM337075 target protein.

The mechanism of the translational inhibition exerted by GAM337075 RNA, herein designated GAM RNA, on one or more GAM337075 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337075 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337075 RNA, herein designated GAM RNA, of GAM337075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337075 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337075 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337075 RNA correlate with, and may be deduced from, the identity of the GAM337075 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337076 6651 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 337076 (GAM337076) oligonucleotides modulates expression of respective target

TTACGGTGAG genes whose function and utility is known in the art.

TGAGATCGCG GAM337076 is a novel bioinformatically detectable regulatory, non protein

CCATTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337076 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAACTCC encoded by the human genome.

GAM337076 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337076 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337076 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337076 precursor RNA is designated SEQ ID:6651, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6651 is located from position 70140219 to position 70140306 relative to chromosome 16 on the `+` strand.

GAM337076 precursor RNA folds onto itself, forming GAM337076 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337076 precursor RNA, designated SEQ ID NO: 6651, and a schematic representation of a predicted secondary folding of GAM337076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337076 folded precursor RNA yielding a GAM337076 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337076 RNA, hereby incorporated herein. Expression of GAM337076 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337076 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337076 target RNA, herein designated GAM TARGET RNA.

GAM337076 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337076 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337076 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337076 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337076 RNA, herein designated GAM RNA, to target binding sites on GAM337076 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337076 target RNA into GAM337076 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337076 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337076 target genes. The mRNA of each one of this

plurality of GAM337076 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337076 RNA, herein designated GAM RNA, and which when bound by GAM337076 RNA causes inhibition of translation of the GAM337076 target mRNA into a corresponding GAM337076 target protein.

The mechanism of the translational inhibition exerted by GAM337076 RNA, herein designated GAM RNA, on one or more GAM337076 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337076 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337076 RNA, herein designated GAM RNA, of GAM337076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337076 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337076 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337076 RNA correlate with, and may be deduced from, the identity of the GAM337076 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337077 6187 CTCTTGACCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGTTCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

AATGAGGGAC Messenger 337077 (GAM337077) oligonucleotides modulates expression of respective target

ATTTTACCTG genes whose function and utility is known in the art.

CCGGGGACAT GAM337077 is a novel bioinformatically detectable regulatory, non protein

TTCCAATGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337077 was detected

TGGGGACACT is described with additional reference to Figs. 9-15.

TTTGGTTATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AG encoded by the human genome.

GAM337077 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337077 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337077 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337077 precursor RNA is designated SEQ ID:6187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6187 is located from position 70161182 to position 70161263 relative to chromosome 5 on the `+` strand.

GAM337077 precursor RNA folds onto itself, forming GAM337077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337077 precursor RNA, designated SEQ ID NO: 6187, and a schematic representation of a predicted secondary folding of GAM337077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337077 folded precursor RNA yielding a GAM337077 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM337077 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337077 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM337077 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337077 target RNA, herein designated GAM TARGET RNA.

GAM337077 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337077 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337077 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337077 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337077 RNA, herein designated GAM RNA, to target binding sites on GAM337077 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337077 target RNA into GAM337077 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337077 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337077 target genes. The mRNA of each one of this plurality of GAM337077 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337077 RNA, herein designated GAM RNA, and which when bound by GAM337077 RNA causes inhibition of translation of the GAM337077 target mRNA into a corresponding GAM337077 target protein.

The mechanism of the translational inhibition exerted by GAM337077 RNA, herein designated GAM RNA, on one or more GAM337077 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337077 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337077 RNA, herein designated GAM RNA, of GAM337077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337077 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337077 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337077 RNA correlate with, and may be deduced from, the identity of the GAM337077 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337078 6638 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 337078 (GAM337078) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGGTCAC GAM337078 is a novel bioinformatically detectable regulatory, non protein

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337078 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM337078 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337078 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337078 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337078 precursor RNA is designated SEQ ID:6638, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6638 is located from position 70180992 to position 70181079 relative to chromosome 5 on the `-` strand.

GAM337078 precursor RNA folds onto itself, forming GAM337078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337078 precursor RNA, designated SEQ ID NO: 6638, and a schematic representation of a predicted secondary folding of GAM337078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337078 folded precursor RNA yielding a GAM337078 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337078 RNA, hereby incorporated herein. Expression of GAM337078 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337078 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337078 target RNA, herein designated GAM TARGET RNA.

GAM337078 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337078 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337078 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337078 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337078 RNA, herein designated GAM RNA, to target binding sites on GAM337078 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337078 target RNA into GAM337078 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337078 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337078 target genes. The mRNA of each one of this plurality of GAM337078 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337078 RNA, herein designated GAM RNA, and which when bound by GAM337078 RNA causes inhibition of translation of the GAM337078 target mRNA into a corresponding GAM337078 target protein.

The mechanism of the translational inhibition exerted by GAM337078 RNA, herein designated GAM RNA, on one or more GAM337078 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337078 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337078 RNA, herein designated GAM RNA, of GAM337078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337078 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337078 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337078 RNA correlate with, and may be deduced from, the identity of the GAM337078 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337079 7107 TGAGGCAAGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACTCAGGAG Messenger 337079 (GAM337079) oligonucleotides modulates expression of respective target
GTGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCA GAM337079 is a novel bioinformatically detectable regulatory, non protein
AGATGCACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337079 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGTGAGA encoded by the human genome.

CTCTGTCTCA GAM337079 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337079 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337079 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337079 precursor RNA is designated SEQ ID:7107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7107 is located from position 70204344 to position 70204443 relative to chromosome 15 on the `-` strand.

GAM337079 precursor RNA folds onto itself, forming GAM337079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337079 precursor RNA, designated SEQ ID NO: 7107, and a schematic representation of a predicted secondary folding of GAM337079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337079 folded precursor RNA yielding a GAM337079 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337079 RNA, hereby incorporated herein. Expression of GAM337079 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337079 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337079 target RNA, herein designated GAM TARGET RNA.

GAM337079 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337079 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337079 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337079 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337079 RNA, herein designated GAM RNA, to target binding sites on GAM337079 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337079 target RNA into GAM337079 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337079 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337079 target genes. The mRNA of each one of this plurality of GAM337079 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337079 RNA, herein designated GAM RNA, and which when bound by GAM337079 RNA causes inhibition of translation of the GAM337079 target mRNA into a corresponding GAM337079 target protein.

The mechanism of the translational inhibition exerted by GAM337079 RNA, herein designated GAM RNA, on one or more GAM337079 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337079 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337079 RNA, herein designated GAM RNA, of GAM337079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337079 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337079 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337079 RNA correlate with, and may be deduced from, the identity of the GAM337079 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337080 6714 GGAGGGGCCA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGAGGAAATG detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGAGTCTTA Messenger 337080 (GAM337080) oligonucleotides modulates expression of respective target
GTGATCTGGA genes whose function and utility is known in the art.

AACATTCCAG GAM337080 is a novel bioinformatically detectable regulatory, non protein
ACTAATTTAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337080 was detected
TATCTTCTCT is described with additional reference to Figs. 9-15.

TTTTTCCCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
C encoded by the human genome.

GAM337080 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337080 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337080 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337080 precursor RNA is designated SEQ ID:6714, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6714 is located from position 70205172 to position 70205252 relative to chromosome 8 on the `+` strand.

GAM337080 precursor RNA folds onto itself, forming GAM337080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337080 precursor RNA, designated SEQ ID NO: 6714, and a schematic representation of a predicted secondary folding of GAM337080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337080 folded precursor

RNA yielding a GAM337080 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337080 RNA, hereby incorporated herein.

GAM337080 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337080 target RNA, herein designated GAM TARGET RNA.

GAM337080 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337080 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337080 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337080 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337080 RNA, herein designated GAM RNA, to target binding sites on GAM337080 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337080 target RNA into GAM337080 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337080 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337080 target genes. The mRNA of each one of this plurality of GAM337080 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337080 RNA, herein designated GAM RNA, and which when bound by GAM337080 RNA causes inhibition of translation of the GAM337080 target mRNA into a corresponding GAM337080 target protein.

The mechanism of the translational inhibition exerted by GAM337080 RNA, herein designated GAM RNA, on one or more GAM337080 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337080 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337080 RNA, herein designated GAM RNA, of GAM337080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337080 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337080 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337080 RNA correlate with, and may be deduced from, the identity of the GAM337080 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337081 7116 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAAGGC Messenger 337081 (GAM337081) oligonucleotides modulates expression of respective target

AGAGGTTGCA genes whose function and utility is known in the art.

GTCAGCAGAT GAM337081 is a novel bioinformatically detectable regulatory, non protein

ATTGCACCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337081 was detected

TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAAGCAAGAC encoded by the human genome.

TCTGCCTCA GAM337081 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337081 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337081 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337081 precursor RNA is designated SEQ ID:7116, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7116 is located from position 70361144 to position 70361242 relative to chromosome 5 on the `+` strand.

GAM337081 precursor RNA folds onto itself, forming GAM337081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337081 precursor RNA, designated SEQ ID NO: 7116, and a schematic representation of a predicted secondary folding of GAM337081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337081 folded precursor RNA yielding a GAM337081 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337081 RNA, hereby incorporated herein. Expression of GAM337081 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337081 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337081 target RNA, herein designated GAM TARGET RNA.

GAM337081 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337081 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337081 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337081 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337081 RNA, herein designated GAM RNA, to target binding sites on GAM337081 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337081 target RNA into GAM337081 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337081 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337081 target genes. The mRNA of each one of this plurality of GAM337081 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337081 RNA, herein designated GAM RNA, and which when bound by GAM337081 RNA causes inhibition of translation of the GAM337081 target mRNA into a corresponding GAM337081 target protein.

The mechanism of the translational inhibition exerted by GAM337081 RNA, herein designated GAM RNA, on one or more GAM337081 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337081 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337081 RNA, herein designated GAM RNA, of GAM337081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337081 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337081 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337081 RNA correlate with, and may be deduced from, the identity of the GAM337081 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337082 6378 GAGGCAGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAAGGCA Messenger 337082 (GAM337082) oligonucleotides modulates expression of respective target

GAGGTTGCAG genes whose function and utility is known in the art.

TCAGCAGATA GAM337082 is a novel bioinformatically detectable regulatory, non protein

TTGCACCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337082 was detected

GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGCAAGACT encoded by the human genome.

CTGCCTC GAM337082 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337082 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337082 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337082 precursor RNA is designated SEQ

ID:6378, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6378 is located from position 70361145 to position 70361241 relative to chromosome 5 on the `+` strand.

GAM337082 precursor RNA folds onto itself, forming GAM337082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337082 precursor RNA, designated SEQ ID NO: 6378, and a schematic representation of a predicted secondary folding of GAM337082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337082 folded precursor RNA yielding a GAM337082 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337082 RNA, hereby incorporated herein. Expression of GAM337082 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337082 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337082 target RNA, herein designated GAM TARGET RNA.

GAM337082 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337082 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337082 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337082 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337082 RNA, herein designated GAM RNA, to target binding sites on GAM337082 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337082 target RNA

into GAM337082 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337082 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337082 target genes. The mRNA of each one of this plurality of GAM337082 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337082 RNA, herein designated GAM RNA, and which when bound by GAM337082 RNA causes inhibition of translation of the GAM337082 target mRNA into a corresponding GAM337082 target protein.

The mechanism of the translational inhibition exerted by GAM337082 RNA, herein designated GAM RNA, on one or more GAM337082 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337082 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337082 RNA, herein designated GAM RNA, of GAM337082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337082 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337082 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337082 RNA correlate with, and may be deduced from, the identity of the GAM337082 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTTGAGCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAGCTGGAG Messenger 337083 (GAM337083) oligonucleotides modulates expression of respective target
CCTGCAGTGA genes whose function and utility is known in the art.

ACTATCATTG GAM337083 is a novel bioinformatically detectable regulatory, non protein
TGCCACTGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337083 was detected
CTCCAGCCTA is described with additional reference to Figs. 9-15.

GGCAACAAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAAATCCTG encoded by the human genome.

TC GAM337083 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337083 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337083 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337083 precursor RNA is designated SEQ ID:6792, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6792 is located from position 70411479 to position 70411570 relative to chromosome 10 on the `+` strand.

GAM337083 precursor RNA folds onto itself, forming GAM337083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337083 precursor RNA, designated SEQ ID NO: 6792, and a schematic representation of a predicted secondary folding of GAM337083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337083 folded precursor RNA yielding a GAM337083 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337083 RNA, hereby incorporated herein.

GAM337083 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337083 target RNA, herein designated GAM TARGET RNA.

GAM337083 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337083 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337083 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337083 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337083 RNA, herein designated GAM RNA, to target binding sites on GAM337083 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337083 target RNA into GAM337083 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337083 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337083 target genes. The mRNA of each one of this plurality of GAM337083 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337083 RNA, herein designated GAM RNA, and which when bound by GAM337083 RNA causes inhibition of translation of the GAM337083 target mRNA into a corresponding GAM337083 target protein.

The mechanism of the translational inhibition exerted by GAM337083 RNA, herein designated GAM RNA, on one or more GAM337083 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337083 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337083 RNA, herein designated GAM RNA, of GAM337083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337083 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337083 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337083 RNA correlate with, and may be deduced from, the identity of the GAM337083 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337084 5762 AGGATTGCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGCCTGGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGGAGCCT Messenger 337084 (GAM337084) oligonucleotides modulates expression of respective target

GCAGTGAACT genes whose function and utility is known in the art.

ATCATTGTGC GAM337084 is a novel bioinformatically detectable regulatory, non protein
CACTGTACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337084 was detected
CAGCCTAGGC is described with additional reference to Figs. 9-15.

AACAAAATGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AATCCT encoded by the human genome.

GAM337084 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337084 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337084 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337084 precursor RNA is designated SEQ ID:5762, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5762 is located from position 70411482 to position 70411567 relative to chromosome 10 on the `+` strand.

GAM337084 precursor RNA folds onto itself, forming GAM337084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337084 precursor RNA, designated SEQ ID NO: 5762, and a schematic representation of a predicted secondary folding of GAM337084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337084 folded precursor RNA yielding a GAM337084 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337084 RNA, hereby incorporated herein.

GAM337084 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337084 target RNA, herein designated GAM TARGET RNA.

GAM337084 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337084 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337084 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337084 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337084 RNA, herein designated GAM RNA, to target binding sites on GAM337084 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337084 target RNA into GAM337084 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337084 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337084 target genes. The mRNA of each one of this plurality of GAM337084 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337084 RNA, herein designated GAM RNA, and which when bound by GAM337084 RNA causes inhibition of translation of the GAM337084 target mRNA into a corresponding GAM337084 target protein.

The mechanism of the translational inhibition exerted by GAM337084 RNA, herein designated GAM RNA, on one or more GAM337084 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337084 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337084 RNA, herein designated GAM RNA, of GAM337084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337084 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337084 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337084 RNA correlate with, and may be deduced from, the identity of the GAM337084 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337087 6492 GCAGGAGGAT Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCTTGAGCC detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGGAGTTCA Messenger 337087 (GAM337087) oligonucleotides modulates expression of respective target
AGGCTACAAT genes whose function and utility is known in the art.

GAGCTATGAT GAM337087 is a novel bioinformatically detectable regulatory, non protein
CACACTACTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337087 was detected
CACTCCAGCC is described with additional reference to Figs. 9-15.

TGGGCAACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCAAGACCC encoded by the human genome.

TGT GAM337087 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337087 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337087 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337087 precursor RNA is designated SEQ ID:6492, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6492 is located from position 70589904 to position 70589996 relative to chromosome 7 on the `+` strand.

GAM337087 precursor RNA folds onto itself, forming GAM337087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337087 precursor RNA, designated SEQ ID NO: 6492, and a schematic representation of a predicted secondary folding of GAM337087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337087 folded precursor RNA yielding a GAM337087 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337087 RNA, hereby incorporated herein.

GAM337087 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337087 target RNA, herein designated GAM TARGET RNA.

GAM337087 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337087 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337087 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337087 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337087 RNA, herein designated GAM RNA, to target binding sites on GAM337087 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337087 target RNA into GAM337087 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337087 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337087 target genes. The mRNA of each one of this plurality of GAM337087 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337087 RNA, herein designated GAM RNA, and which when bound by GAM337087 RNA causes inhibition of translation of the GAM337087 target mRNA into a corresponding GAM337087 target protein.

The mechanism of the translational inhibition exerted by GAM337087 RNA, herein designated GAM RNA, on one or more GAM337087 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337087 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337087 RNA, herein designated GAM RNA, of GAM337087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337087 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337087 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337087 RNA correlate with, and may be deduced from, the identity of the GAM337087 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337088 5805 AGTCCTCTTA Fig. 8 further provides a conceptual description of another novel bioinformatically

It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337091 RNA, herein designated GAM RNA, to target binding sites on GAM337091 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337091 target RNA into GAM337091 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337091 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337091 target genes. The mRNA of each one of this plurality of GAM337091 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337091 RNA,

herein designated GAM RNA, and which when bound by GAM337091 RNA causes inhibition of translation of the GAM337091 target mRNA into a corresponding GAM337091 target protein.

The mechanism of the translational inhibition exerted by GAM337091 RNA, herein designated GAM RNA, on one or more GAM337091 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337091 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337091 RNA, herein designated GAM RNA, of GAM337091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337091 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337091 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337091 RNA correlate with, and may be deduced from, the identity of the GAM337091 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337092 5887 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337092 (GAM337092) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337092 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337092 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337092 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337092 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337092 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337092 precursor RNA is designated SEQ ID:5887, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5887 is located from position 70852306 to position 70852387 relative to chromosome 14 on the `+` strand.

GAM337092 precursor RNA folds onto itself, forming GAM337092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337092 precursor RNA, designated SEQ ID NO: 5887, and a schematic representation of a predicted secondary folding of GAM337092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337092 folded precursor RNA yielding a GAM337092 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337092 RNA, hereby incorporated herein.

GAM337092 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337092 target RNA, herein designated GAM TARGET RNA.

GAM337092 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337092 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337092 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337092 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337092 RNA, herein designated GAM RNA, to target binding sites on GAM337092 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337092 target RNA

into GAM337092 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337092 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337092 target genes. The mRNA of each one of this plurality of GAM337092 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337092 RNA, herein designated GAM RNA, and which when bound by GAM337092 RNA causes inhibition of translation of the GAM337092 target mRNA into a corresponding GAM337092 target protein.

The mechanism of the translational inhibition exerted by GAM337092 RNA, herein designated GAM RNA, on one or more GAM337092 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337092 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337092 RNA, herein designated GAM RNA, of GAM337092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337092 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337092 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337092 RNA correlate with, and may be deduced from, the identity of the GAM337092 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337093 6814 GGGGCTTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCTGGCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTCCTGGGA Messenger 337093 (GAM337093) oligonucleotides modulates expression of respective target

TTTCAAACTA genes whose function and utility is known in the art.

CCTCACCAAC GAM337093 is a novel bioinformatically detectable regulatory, non protein

AGGACGCTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337093 was detected

ACCAGGAGCC is described with additional reference to Figs. 9-15.

TGCCACCCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGGCCCC encoded by the human genome.

GAM337093 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337093 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337093 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337093 precursor RNA is designated SEQ ID:6814, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6814 is located from position 71022428 to position 71022515 relative to chromosome 14 on the `+` strand.

GAM337093 precursor RNA folds onto itself, forming GAM337093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337093 precursor RNA, designated SEQ ID NO: 6814, and a schematic representation of a predicted secondary folding of GAM337093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337093 folded precursor RNA yielding a GAM337093 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337093 RNA, hereby incorporated herein.

GAM337093 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337093 target RNA, herein designated GAM TARGET RNA.

GAM337093 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337093 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337093 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337093 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337093 RNA, herein designated GAM RNA, to target binding sites on GAM337093 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337093 target RNA into GAM337093 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337093 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337093 target genes. The mRNA of each one of this plurality of GAM337093 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337093 RNA, herein designated GAM RNA, and which when bound by GAM337093 RNA causes inhibition of translation of the GAM337093 target mRNA into a corresponding GAM337093 target protein.

The mechanism of the translational inhibition exerted by GAM337093 RNA, herein designated GAM RNA, on one or more GAM337093 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337093 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337093 RNA, herein designated GAM RNA, of GAM337093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337093 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337093 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337093 RNA correlate with, and may be deduced from, the identity of the GAM337093 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337094 5888 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337096 (GAM337096) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337096 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337096 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337096 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337096 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337096 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337096 precursor RNA is designated SEQ ID:6384, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6384 is located from position 71522779 to position 71522877 relative to chromosome 7 on the `+` strand.

GAM337096 precursor RNA folds onto itself, forming GAM337096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337096 precursor RNA, designated SEQ ID NO: 6384, and a schematic representation of a predicted secondary folding of GAM337096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337096 folded precursor RNA yielding a GAM337096 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337096 RNA, hereby incorporated herein.

GAM337096 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337096 target RNA, herein designated GAM TARGET RNA.

GAM337096 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337096 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337096 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337096 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337096 RNA, herein designated GAM RNA, to target binding sites on GAM337096 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337096 target RNA into GAM337096 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337096 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337096 target genes. The mRNA of each one of this plurality of GAM337096 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337096 RNA, herein designated GAM RNA, and which when bound by GAM337096 RNA causes inhibition of translation of the GAM337096 target mRNA into a corresponding GAM337096 target protein.

The mechanism of the translational inhibition exerted by GAM337096 RNA, herein designated GAM RNA, on one or more GAM337096 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337096 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337096 RNA, herein designated GAM RNA, of

GAM337096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337096 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337096 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337096 RNA correlate with, and may be deduced from, the identity of the GAM337096 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337097 6528 GCTAGTGTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACACACAGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTTGGAAAGC Messenger 337097 (GAM337097) oligonucleotides modulates expression of respective target

ATGTACATTT genes whose function and utility is known in the art.

GGAGGATATA GAM337097 is a novel bioinformatically detectable regulatory, non protein

GTGTCTTCTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337097 was detected

AATAATTATA is described with additional reference to Figs. 9-15.

CACTTTCTAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGAGTAGGG encoded by the human genome.

TGGCTTACAG GAM337097 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGGC GAM337097 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337097 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337097 precursor RNA is designated SEQ ID:6528, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6528 is located from position 71688944 to position 71689047 relative to chromosome 17 on the `+` strand.

GAM337097 precursor RNA folds onto itself, forming GAM337097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337097 precursor RNA, designated SEQ ID NO: 6528, and a schematic representation of a predicted secondary folding of GAM337097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337097 folded precursor RNA yielding a GAM337097 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337097 RNA, hereby incorporated herein.

GAM337097 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337097 target RNA, herein designated GAM TARGET RNA.

GAM337097 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337097 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337097 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337097 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337097 RNA, herein designated GAM RNA, to target binding sites on GAM337097 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337097 target RNA into GAM337097 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337097 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337097 target genes. The mRNA of each one of this plurality of GAM337097 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337097 RNA, herein designated GAM RNA, and which when bound by GAM337097 RNA causes inhibition of translation of the GAM337097 target mRNA into a corresponding GAM337097 target protein.

The mechanism of the translational inhibition exerted by GAM337097 RNA, herein designated GAM RNA, on one or more GAM337097 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337097 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337097 RNA, herein designated GAM RNA, of GAM337097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337097 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337097 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337097 RNA correlate with, and may be deduced from, the identity of the GAM337097 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337098 7082 TCTTTTCTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTAGGCTAG detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTTCGAGAC Messenger 337098 (GAM337098) oligonucleotides modulates expression of respective target

TGCATTACCC genes whose function and utility is known in the art.

TCCCCAACTT GAM337098 is a novel bioinformatically detectable regulatory, non protein

AAAATCTTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337098 was detected

GATAACCCAG is described with additional reference to Figs. 9-15.

GCAGCTGGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TATCCCCAAT encoded by the human genome.

TTAAAGTCTT GAM337098 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTTGTTGTAG GAM337098 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

CTGTATGGCA GAM337098 precursor RNA does not encode a protein. A nucleotide sequence identical or

TTTATCTAGA highly similar to the nucleotide sequence of GAM337098 precursor RNA is designated SEQ

ID:7082, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:7082 is located from position 71710852 to position 71710981

relative to chromosome X on the `-` strand.

GAM337098 precursor RNA folds onto itself, forming GAM337098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337098 precursor RNA, designated SEQ ID NO: 7082, and a schematic representation of a predicted secondary folding of GAM337098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337098 folded precursor RNA yielding a GAM337098 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337098 RNA, hereby incorporated herein.

GAM337098 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337098 target RNA, herein designated GAM TARGET RNA.

GAM337098 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337098 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337098 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337098 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337098 RNA, herein designated GAM RNA, to target binding sites on GAM337098 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337098 target RNA into GAM337098 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337098 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337098 target genes. The mRNA of each one of this plurality of GAM337098 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337098 RNA, herein designated GAM RNA, and which when bound by GAM337098 RNA causes inhibition of translation of the GAM337098 target mRNA into a corresponding GAM337098 target protein.

The mechanism of the translational inhibition exerted by GAM337098 RNA, herein designated GAM RNA, on one or more GAM337098 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337098 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337098 RNA, herein designated GAM RNA, of GAM337098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337098 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337098 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337098 RNA correlate with, and may be deduced from, the identity of the GAM337098 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337099 5889 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337099 (GAM337099) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337099 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337099 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337099 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337099 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337099 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337099 precursor RNA is designated SEQ ID:5889, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5889 is located from position 71711305 to position 71711386 relative to chromosome 13 on the `+` strand.

GAM337099 precursor RNA folds onto itself, forming GAM337099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337099 precursor RNA, designated SEQ ID NO: 5889, and a schematic representation of a predicted secondary folding of GAM337099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337099 folded precursor RNA yielding a GAM337099 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337099 RNA, hereby incorporated herein.

GAM337099 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337099 target RNA, herein designated GAM TARGET RNA.

GAM337099 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337099 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337099 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337099 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337099 RNA, herein designated GAM RNA, to target

binding sites on GAM337099 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337099 target RNA into GAM337099 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337099 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337099 target genes. The mRNA of each one of this plurality of GAM337099 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337099 RNA, herein designated GAM RNA, and which when bound by GAM337099 RNA causes inhibition of translation of the GAM337099 target mRNA into a corresponding GAM337099 target protein.

The mechanism of the translational inhibition exerted by GAM337099 RNA, herein designated GAM RNA, on one or more GAM337099 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337099 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337099 RNA, herein designated GAM RNA, of GAM337099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337099 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337099 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337099 RNA correlate with, and may be deduced from, the identity of the GAM337099 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337100 6567 GCTTGGTATG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCAGAAGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTAAAGTGT Messenger 337100 (GAM337100) oligonucleotides modulates expression of respective target

GTATGGGCAG genes whose function and utility is known in the art.

GTGTGGGGGC GAM337100 is a novel bioinformatically detectable regulatory, non protein

AATTTCTTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337100 was detected

TCCTAGCACT is described with additional reference to Figs. 9-15.

TCCATATATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACTTTCTTT encoded by the human genome.

TCTGGCTGCT GAM337100 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAGT GAM337100 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337100 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337100 precursor RNA is designated SEQ ID:6567, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6567 is located from position 71825337 to position 71825440 relative to chromosome 16 on the `+` strand.

GAM337100 precursor RNA folds onto itself, forming GAM337100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337100 precursor RNA, designated SEQ ID NO: 6567, and a schematic representation of a predicted secondary folding of GAM337100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337100 folded precursor RNA yielding a GAM337100 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337100 RNA, hereby incorporated herein.

GAM337100 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337100 target RNA, herein designated GAM TARGET RNA.

GAM337100 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337100 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337100 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337100 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337100 RNA, herein designated GAM RNA, to target binding sites on GAM337100 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337100 target RNA into GAM337100 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337100 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337100 target genes. The mRNA of each one of this plurality of GAM337100 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337100 RNA, herein designated GAM RNA, and which when bound by GAM337100 RNA causes inhibition of translation of the GAM337100 target mRNA into a corresponding GAM337100 target protein.

The mechanism of the translational inhibition exerted by GAM337100 RNA, herein designated GAM RNA, on one or more GAM337100 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337100 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337100 RNA, herein designated GAM RNA, of GAM337100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337100 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337100 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337100 RNA correlate with, and may be deduced from, the identity of the GAM337100 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337101 6860 GTAGAGAACC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTACTCTTGG GAM337101 is a novel bioinformatically detectable regulatory, non protein
GATAGTGTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337101 was detected
CATGGCCCTG is described with additional reference to Figs. 9-15.

TGAGGGAACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTAC encoded by the human genome.

GAM337101 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337101 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337101 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337101 precursor RNA is designated SEQ ID:6860, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6860 is located from position 71906731 to position 71906814 relative to chromosome 12 on the `+` strand.

GAM337101 precursor RNA folds onto itself, forming GAM337101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337101 precursor RNA, designated SEQ ID NO: 6860, and a schematic representation of a predicted secondary folding of GAM337101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337101 folded precursor RNA yielding a GAM337101 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337101 RNA, hereby incorporated herein.

GAM337101 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337101 target RNA, herein designated GAM TARGET RNA.

GAM337101 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337101 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337101 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337101 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337101 RNA, herein designated GAM RNA, to target binding sites on GAM337101 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337101 target RNA into GAM337101 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337101 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337101 target genes. The mRNA of each one of this plurality of GAM337101 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337101 RNA, herein designated GAM RNA, and which when bound by GAM337101 RNA causes inhibition of translation of the GAM337101 target mRNA into a corresponding GAM337101 target protein.

The mechanism of the translational inhibition exerted by GAM337101 RNA, herein designated GAM RNA, on one or more GAM337101 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337101 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337101 RNA, herein designated GAM RNA, of GAM337101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337101 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337101 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337101

RNA correlate with, and may be deduced from, the identity of the GAM337101 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337105 6802 GGGCCAAAAA Fig. 8 further provides a conceptual description of another novel bioinformatically
TTCAAGATGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCATTTGCAA Messenger 337105 (GAM337105) oligonucleotides modulates expression of respective target
GTTGTCTTCT genes whose function and utility is known in the art.

AGGGTGTTGC GAM337105 is a novel bioinformatically detectable regulatory, non protein
CTGAACCTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337105 was detected
GCTGCAGTAG is described with additional reference to Figs. 9-15.

AAGTGGGGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGAGGTAGG encoded by the human genome.

CGATATTGAA GAM337105 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
ATCCC GAM337105 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337105 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337105 precursor RNA is designated SEQ ID:6802, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6802 is located from position 71960660 to position 71960764 relative to chromosome 11 on the `-` strand.

GAM337105 precursor RNA folds onto itself, forming GAM337105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337105 precursor RNA, designated SEQ ID NO: 6802, and a schematic representation of a predicted secondary folding of GAM337105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337105 folded precursor RNA yielding a GAM337105 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337105 RNA, hereby incorporated herein.

GAM337105 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337105 target RNA, herein designated GAM TARGET RNA.

GAM337105 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337105 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337105 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337105 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337105 RNA, herein designated GAM RNA, to target binding sites on GAM337105 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337105 target RNA into GAM337105 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337105 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337105 target genes. The mRNA of each one of this plurality of GAM337105 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337105 RNA, herein designated GAM RNA, and which when bound by GAM337105 RNA causes inhibition of translation of the GAM337105 target mRNA into a corresponding GAM337105 target protein.

The mechanism of the translational inhibition exerted by GAM337105 RNA, herein designated GAM RNA, on one or more GAM337105 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337105 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337105 RNA, herein designated GAM RNA, of GAM337105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337105 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337105 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337105 RNA correlate with, and may be deduced from, the identity of the GAM337105 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337106 6021 CAGCTTGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
CACACACAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATTGGTCATG Messenger 337106 (GAM337106) oligonucleotides modulates expression of respective target
AGGTCAGCTG genes whose function and utility is known in the art.

CTCTCTGACC GAM337106 is a novel bioinformatically detectable regulatory, non protein
CACTTGCTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337106 was detected
GAGTTGTTTG is described with additional reference to Figs. 9-15.

CTGCCTGTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337106 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337106 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337106 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337106 precursor RNA is designated SEQ ID:6021, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6021 is located from position 72006752 to position 72006831 relative to chromosome 14 on the `+` strand.

GAM337106 precursor RNA folds onto itself, forming GAM337106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337106 precursor RNA, designated SEQ ID NO: 6021, and a schematic representation of a predicted secondary folding of GAM337106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337106 folded precursor RNA yielding a GAM337106 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337106 RNA, hereby incorporated herein.

GAM337106 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337106 target RNA, herein designated GAM TARGET RNA.

GAM337106 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337106 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337106 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337106 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337106 RNA, herein designated GAM RNA, to target binding sites on GAM337106 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337106 target RNA into GAM337106 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337106 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337106 target genes. The mRNA of each one of this plurality of GAM337106 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337106 RNA, herein designated GAM RNA, and which when bound by GAM337106 RNA causes inhibition of translation of the GAM337106 target mRNA into a corresponding GAM337106 target protein.

The mechanism of the translational inhibition exerted by GAM337106 RNA, herein designated GAM RNA, on one or more GAM337106 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337106 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337106 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337106 RNA, herein designated GAM RNA, of GAM337106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337106 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337106 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337106 RNA correlate with, and may be deduced from, the identity of the GAM337106 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337108 6022 CAGCTTGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CACACACAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTGGTCATG Messenger 337108 (GAM337108) oligonucleotides modulates expression of respective target

AGGTCAGCTG genes whose function and utility is known in the art.

CTCTCTGACC GAM337108 is a novel bioinformatically detectable regulatory, non protein

CACTTGCTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337108 was detected

GAGTTGTTTG is described with additional reference to Figs. 9-15.

CTGCCTGTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337108 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337108 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337108 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337108 precursor RNA is designated SEQ ID:6022, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6022 is located from position 72038936 to position 72039015 relative to chromosome 14 on the `+` strand.

GAM337108 precursor RNA folds onto itself, forming GAM337108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337108 precursor RNA, designated SEQ ID NO: 6022, and a schematic representation of a predicted secondary folding of GAM337108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337108 folded precursor RNA yielding a GAM337108 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337108 RNA, hereby incorporated herein.

GAM337108 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337108 target RNA, herein designated GAM TARGET RNA.

GAM337108 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337108 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337108 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337108 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337108 RNA, herein designated GAM RNA, to target binding sites on GAM337108 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337108 target RNA into GAM337108 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337108 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337108 target genes. The mRNA of each one of this plurality of GAM337108 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337108 RNA, herein designated GAM RNA, and which when bound by GAM337108 RNA causes inhibition of translation of the GAM337108 target mRNA into a corresponding GAM337108 target protein.

The mechanism of the translational inhibition exerted by GAM337108 RNA, herein

designated GAM RNA, on one or more GAM337108 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337108 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337108 RNA, herein designated GAM RNA, of GAM337108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337108 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337108 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337108 RNA correlate with, and may be deduced from, the identity of the GAM337108 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTTTGTAGT Messenger 337109 (GAM337109) oligonucleotides modulates expression of respective target

CTCAGTACTT genes whose function and utility is known in the art.

TGGGAGGCCA GAM337109 is a novel bioinformatically detectable regulatory, non protein

AAGATGGGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337109 was detected

GATTGCTTGA is described with additional reference to Figs. 9-15.

GCCCGTGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGAGACCAG encoded by the human genome.

CCT GAM337109 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337109 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337109 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337109 precursor RNA is designated SEQ ID:6806, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6806 is located from position 72098256 to position 72098348

relative to chromosome 7 on the `-` strand.

GAM337109 precursor RNA folds onto itself, forming GAM337109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337109 precursor RNA, designated SEQ ID NO: 6806, and a schematic representation of a predicted secondary folding of GAM337109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337109 folded precursor RNA yielding a GAM337109 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337109 RNA, hereby incorporated herein.

GAM337109 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337109 target RNA, herein designated GAM TARGET RNA.

GAM337109 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337109 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337109 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337109 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337109 RNA, herein designated GAM RNA, to target binding sites on GAM337109 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337109 target RNA into GAM337109 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337109 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337109 target genes. The mRNA of each one of this plurality of GAM337109 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337109 RNA, herein designated GAM RNA, and which when bound by GAM337109 RNA causes inhibition of translation of the GAM337109 target mRNA into a corresponding GAM337109 target protein.

The mechanism of the translational inhibition exerted by GAM337109 RNA, herein designated GAM RNA, on one or more GAM337109 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337109 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337109 RNA, herein designated GAM RNA, of GAM337109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337109 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337109 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337109 RNA correlate with, and may be deduced from, the identity of the GAM337109 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337110 5890 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337110 (GAM337110) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337110 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337110 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337110 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337110 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337110 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337110 precursor RNA is designated SEQ ID:5890, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5890 is located from position 72187619 to position 72187700 relative to chromosome 13 on the `-` strand.

GAM337110 precursor RNA folds onto itself, forming GAM337110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337110 precursor RNA, designated SEQ ID NO: 5890, and a schematic representation of a predicted secondary folding of GAM337110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337110 folded precursor RNA yielding a GAM337110 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337110 RNA, hereby incorporated herein.

GAM337110 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337110 target RNA, herein designated GAM TARGET RNA.

GAM337110 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337110 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337110 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337110 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337110 RNA, herein designated GAM RNA, to target

binding sites on GAM337110 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337110 target RNA into GAM337110 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337110 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337110 target genes. The mRNA of each one of this plurality of GAM337110 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337110 RNA, herein designated GAM RNA, and which when bound by GAM337110 RNA causes inhibition of translation of the GAM337110 target mRNA into a corresponding GAM337110 target protein.

The mechanism of the translational inhibition exerted by GAM337110 RNA, herein designated GAM RNA, on one or more GAM337110 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337110 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337110 RNA, herein designated GAM RNA, of GAM337110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337110 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337110 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337110 RNA correlate with, and may be deduced from, the identity of the GAM337110 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337111 6356 GAGATGGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCACTTAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCCAGGAAT Messenger 337111 (GAM337111) oligonucleotides modulates expression of respective target

TTGAGGCTGC genes whose function and utility is known in the art.

AGTGAGCAAT GAM337111 is a novel bioinformatically detectable regulatory, non protein

GACTGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337111 was detected

CTGTACTTCA is described with additional reference to Figs. 9-15.

GCCTGGGTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGGGGAC encoded by the human genome.

TTCATTTC GAM337111 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337111 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337111 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337111 precursor RNA is designated SEQ ID:6356, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6356 is located from position 72274763 to position 72274860 relative to chromosome 7 on the `+` strand.

GAM337111 precursor RNA folds onto itself, forming GAM337111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337111 precursor RNA, designated SEQ ID NO: 6356, and a schematic representation of a predicted secondary folding of GAM337111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337111 folded precursor RNA yielding a GAM337111 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337111 RNA, hereby incorporated herein.

GAM337111 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337111 target RNA, herein designated GAM TARGET RNA.

GAM337111 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337111 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337111 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337111 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337111 RNA, herein designated GAM RNA, to target binding sites on GAM337111 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337111 target RNA into GAM337111 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337111 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337111 target genes. The mRNA of each one of this plurality of GAM337111 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337111 RNA, herein designated GAM RNA, and which when bound by GAM337111 RNA causes inhibition of translation of the GAM337111 target mRNA into a corresponding GAM337111 target protein.

The mechanism of the translational inhibition exerted by GAM337111 RNA, herein designated GAM RNA, on one or more GAM337111 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337111 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337111 RNA, herein designated GAM RNA, of GAM337111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337111 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337111 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337111 RNA correlate with, and may be deduced from, the identity of the GAM337111 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337112 6603 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAAGCCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAATTTGAGG Messenger 337112 (GAM337112) oligonucleotides modulates expression of respective target
CTGCAGTGAG genes whose function and utility is known in the art.

CAATGACTGT GAM337112 is a novel bioinformatically detectable regulatory, non protein
GCCACTGTAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337112 was detected
TTCAGCCTGG is described with additional reference to Figs. 9-15.

GTAACAGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGACTTC encoded by the human genome.

GAM337112 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337112 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337112 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337112 precursor RNA is designated SEQ ID:6603, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6603 is located from position 72274769 to position 72274855 relative to chromosome 7 on the `+` strand.

GAM337112 precursor RNA folds onto itself, forming GAM337112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337112 precursor RNA, designated SEQ ID NO: 6603, and a schematic representation of a predicted secondary folding of GAM337112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337112 folded precursor RNA yielding a GAM337112 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337112 RNA, hereby incorporated herein.

GAM337112 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337112 target RNA, herein designated GAM TARGET RNA.

GAM337112 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337112 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337112 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337112 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337112 RNA, herein designated GAM RNA, to target binding sites on GAM337112 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337112 target RNA into GAM337112 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337112 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337112 target genes. The mRNA of each one of this plurality of GAM337112 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337112 RNA, herein designated GAM RNA, and which when bound by GAM337112 RNA causes inhibition of translation of the GAM337112 target mRNA into a corresponding GAM337112 target protein.

The mechanism of the translational inhibition exerted by GAM337112 RNA, herein designated GAM RNA, on one or more GAM337112 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337112 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337112 RNA, herein designated GAM RNA, of GAM337112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337112 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337112 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337112

RNA correlate with, and may be deduced from, the identity of the GAM337112 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337113 (GAM337113) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337113 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337113 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337113 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337113 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337113 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337113 precursor RNA is designated SEQ ID:6303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6303 is located from position 72274772 to position 72274855 relative to chromosome 7 on the `+` strand.

GAM337113 precursor RNA folds onto itself, forming GAM337113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337113 precursor RNA, designated SEQ ID NO: 6303, and a schematic representation of a predicted secondary folding of GAM337113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337113 folded precursor RNA yielding a GAM337113 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337113 RNA, hereby incorporated herein.

GAM337113 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337113 target RNA, herein designated GAM TARGET RNA.

GAM337113 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337113 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337113 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337113 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337113 RNA, herein designated GAM RNA, to target binding sites on GAM337113 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337113 target RNA into GAM337113 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337113 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337113 target genes. The mRNA of each one of this plurality of GAM337113 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337113 RNA, herein designated GAM RNA, and which when bound by GAM337113 RNA causes inhibition of translation of the GAM337113 target mRNA into a corresponding GAM337113 target protein.

The mechanism of the translational inhibition exerted by GAM337113 RNA, herein designated GAM RNA, on one or more GAM337113 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337113 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337113 RNA, herein designated GAM RNA, of GAM337113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337113 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337113 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337113 RNA correlate with, and may be deduced from, the identity of the GAM337113 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCCTCCAACA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337115 was detected
CAAGCAGCTC is described with additional reference to Figs. 9-15.

AAGTCTTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGACCT encoded by the human genome.

GAM337115 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337115 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337115 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337115 precursor RNA is designated SEQ ID:5781, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5781 is located from position 72530482 to position 72530568 relative to chromosome 17 on the `+` strand.

GAM337115 precursor RNA folds onto itself, forming GAM337115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337115 precursor RNA, designated SEQ ID NO: 5781, and a schematic representation of a predicted secondary folding of GAM337115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337115 folded precursor RNA yielding a GAM337115 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337115 RNA, hereby incorporated herein.

GAM337115 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337115 target RNA, herein designated GAM TARGET RNA.

GAM337115 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337115 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337115 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337115 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337115 RNA, herein designated GAM RNA, to target binding sites on GAM337115 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337115 target RNA into GAM337115 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337115 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337115 target genes. The mRNA of each one of this plurality of GAM337115 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337115 RNA, herein designated GAM RNA, and which when bound by GAM337115 RNA causes inhibition of translation of the GAM337115 target mRNA into a corresponding GAM337115 target protein.

The mechanism of the translational inhibition exerted by GAM337115 RNA, herein designated GAM RNA, on one or more GAM337115 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337115 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337115 RNA, herein designated GAM RNA, of GAM337115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337115 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337115 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337115 RNA correlate with, and may be deduced from, the identity of the GAM337115 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTATAAGCGC GAM337118 is a novel bioinformatically detectable regulatory, non protein

AGAGTATTAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337118 was detected

CTATATCACC is described with additional reference to Figs. 9-15.

GTGAAAGTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATCGCATACA encoded by the human genome.

GGACAG GAM337118 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337118 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337118 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337118 precursor RNA is designated SEQ ID:6239, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6239 is located from position 72678382 to position 72678477 relative to chromosome 18 on the `-` strand.

GAM337118 precursor RNA folds onto itself, forming GAM337118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337118 precursor RNA, designated SEQ ID NO: 6239, and a schematic representation of a predicted secondary folding of GAM337118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337118 folded precursor RNA yielding a GAM337118 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337118 RNA, hereby incorporated herein.

GAM337118 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337118 target RNA, herein designated GAM TARGET RNA.

GAM337118 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337118 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337118 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337118 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337118 RNA, herein designated GAM RNA, to target binding sites on GAM337118 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337118 target RNA into GAM337118 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337118 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337118 target genes. The mRNA of each one of this plurality of GAM337118 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337118 RNA, herein designated GAM RNA, and which when bound by GAM337118 RNA causes inhibition of translation of the GAM337118 target mRNA into a corresponding GAM337118 target protein.

The mechanism of the translational inhibition exerted by GAM337118 RNA, herein

designated GAM RNA, on one or more GAM337118 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337118 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337118 RNA, herein designated GAM RNA, of GAM337118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337118 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337118 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337118 RNA correlate with, and may be deduced from, the identity of the GAM337118 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337119 6839 GGTCTCCCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCCCAGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGGAGTGCAG Messenger 337119 (GAM337119) oligonucleotides modulates expression of respective target

TGATGCAATC genes whose function and utility is known in the art.

ATAGTTCACT GAM337119 is a novel bioinformatically detectable regulatory, non protein

GCAACCTTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337119 was detected

GGGTTCAAGT is described with additional reference to Figs. 9-15.

GATTTTCCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTCAGCCTC encoded by the human genome.

CCAAGTAGTT GAM337119 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAGACT GAM337119 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337119 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337119 precursor RNA is designated SEQ ID:6839, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6839 is located from position 73042551 to position 73042656 relative to chromosome 7 on the `-` strand.

GAM337119 precursor RNA folds onto itself, forming GAM337119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337119 precursor RNA, designated SEQ ID NO: 6839, and a schematic representation of a predicted secondary folding of GAM337119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337119 folded precursor RNA yielding a GAM337119 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337119 RNA, hereby incorporated herein.

GAM337119 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337119 target RNA, herein designated GAM TARGET RNA.

GAM337119 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337119 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337119 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337119 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337119 RNA, herein designated GAM RNA, to target binding sites on GAM337119 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337119 target RNA into GAM337119 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337119 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337119 target genes. The mRNA of each one of this plurality of GAM337119 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337119 RNA, herein designated GAM RNA, and which when bound by GAM337119 RNA causes inhibition of translation of the GAM337119 target mRNA into a corresponding GAM337119 target protein.

The mechanism of the translational inhibition exerted by GAM337119 RNA, herein designated GAM RNA, on one or more GAM337119 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337119 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337119 RNA, herein designated GAM RNA, of GAM337119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337119 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337119 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337119 RNA correlate with, and may be deduced from, the identity of the GAM337119 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337126 6360 GAGCCATTAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTCGGGGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAGCCTCTC Messenger 337126 (GAM337126) oligonucleotides modulates expression of respective target

TTAACGGACC genes whose function and utility is known in the art.

TTCCAGGCAC GAM337126 is a novel bioinformatically detectable regulatory, non protein

TGCTGAGAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337126 was detected

ACCAGGTTAA is described with additional reference to Figs. 9-15.

TGGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337126 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337126 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337126 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337126 precursor RNA is designated SEQ ID:6360, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6360 is located from position 73205614 to position 73205689 relative to chromosome 11 on the `+` strand.

GAM337126 precursor RNA folds onto itself, forming GAM337126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337126 precursor RNA, designated SEQ ID NO: 6360, and a schematic representation of a predicted secondary folding of GAM337126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337126 folded precursor RNA yielding a GAM337126 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337126 RNA, hereby incorporated herein.

GAM337126 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337126 target RNA, herein designated GAM TARGET RNA.

GAM337126 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337126 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337126 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337126 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337126 RNA, herein designated GAM RNA, to target binding sites on GAM337126 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337126 target RNA into GAM337126 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337126 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337126 target genes. The mRNA of each one of this plurality of GAM337126 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337126 RNA, herein designated GAM RNA, and which when bound by GAM337126 RNA causes inhibition of translation of the GAM337126 target mRNA into a corresponding GAM337126 target protein.

The mechanism of the translational inhibition exerted by GAM337126 RNA, herein designated GAM RNA, on one or more GAM337126 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337126 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337126 RNA, herein designated GAM RNA, of GAM337126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337126 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337126 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337126 RNA correlate with, and may be deduced from, the identity of the GAM337126 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337127 7146 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCTGGCAG Messenger 337127 (GAM337127) oligonucleotides modulates expression of respective target

GTGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM337127 is a novel bioinformatically detectable regulatory, non protein

AGATCGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337127 was detected

ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGCACAA encoded by the human genome.

AACTGTCTCA GAM337127 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337127 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337127 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337127 precursor RNA is designated SEQ ID:7146, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7146 is located from position 73215042 to position 73215141 relative to chromosome 7 on the `+` strand.

GAM337127 precursor RNA folds onto itself, forming GAM337127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337127 precursor RNA, designated SEQ ID NO: 7146, and a schematic representation of a predicted secondary folding of GAM337127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337127 folded precursor RNA yielding a GAM337127 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337127 RNA, hereby incorporated herein. Expression of GAM337127 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337127 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337127 target RNA, herein designated GAM TARGET RNA.

GAM337127 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337127 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337127 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337127 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337127 RNA, herein designated GAM RNA, to target binding sites on GAM337127 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337127 target RNA into GAM337127 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337127 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337127 target genes. The mRNA of each one of this plurality of GAM337127 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337127 RNA, herein designated GAM RNA, and which when bound by GAM337127 RNA causes inhibition of translation of the GAM337127 target mRNA into a corresponding GAM337127 target protein.

The mechanism of the translational inhibition exerted by GAM337127 RNA, herein designated GAM RNA, on one or more GAM337127 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337127 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337127 RNA, herein designated GAM RNA, of GAM337127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337127 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337127 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337127 RNA correlate with, and may be deduced from, the identity of the GAM337127 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GATCGCACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337128 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGCACAAA encoded by the human genome.

ACTGTCTC GAM337128 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337128 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337128 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337128 precursor RNA is designated SEQ ID:6399, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6399 is located from position 73215043 to position 73215140 relative to chromosome 7 on the `+` strand.

GAM337128 precursor RNA folds onto itself, forming GAM337128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337128 precursor RNA, designated SEQ ID NO: 6399, and a schematic representation of a predicted secondary folding of GAM337128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337128 folded precursor RNA yielding a GAM337128 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337128 RNA, hereby incorporated herein. Expression of GAM337128 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337128 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337128 target RNA, herein designated GAM TARGET RNA.

GAM337128 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337128 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337128 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337128 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337128 RNA, herein designated GAM RNA, to target binding sites on GAM337128 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337128 target RNA into GAM337128 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337128 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337128 target genes. The mRNA of each one of this plurality of GAM337128 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337128 RNA, herein designated GAM RNA, and which when bound by GAM337128 RNA causes inhibition of translation of the GAM337128 target mRNA into a corresponding GAM337128 target protein.

The mechanism of the translational inhibition exerted by GAM337128 RNA, herein designated GAM RNA, on one or more GAM337128 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337128 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337128 RNA, herein designated GAM RNA, of GAM337128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337128 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337128 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337128 RNA correlate with, and may be deduced from, the identity of the GAM337128 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGTGAGCCGA GAM337129 is a novel bioinformatically detectable regulatory, non protein
GATCATGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337129 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGCGAGA encoded by the human genome.

CTCCGTCTC GAM337129 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337129 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337129 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337129 precursor RNA is designated SEQ ID:6412, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6412 is located from position 73257733 to position 73257831 relative to chromosome 3 on the `-` strand.

GAM337129 precursor RNA folds onto itself, forming GAM337129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337129 precursor RNA, designated SEQ ID NO: 6412, and a schematic representation of a predicted secondary folding of GAM337129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337129 folded precursor RNA yielding a GAM337129 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337129 RNA, hereby incorporated herein. Expression of GAM337129 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337129 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337129 target RNA, herein designated GAM TARGET RNA.

GAM337129 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337129 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337129 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337129 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337129 RNA, herein designated GAM RNA, to target binding sites on GAM337129 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337129 target RNA into GAM337129 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337129 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337129 target genes. The mRNA of each one of this plurality of GAM337129 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337129 RNA, herein designated GAM RNA, and which when bound by GAM337129 RNA causes inhibition of translation of the GAM337129 target mRNA into a corresponding GAM337129 target protein.

The mechanism of the translational inhibition exerted by GAM337129 RNA, herein designated GAM RNA, on one or more GAM337129 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337129 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337129 RNA, herein designated GAM RNA, of GAM337129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337129 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337129 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337129 RNA correlate with, and may be deduced from, the identity of the GAM337129 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337130 6609 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 337130 (GAM337130) oligonucleotides modulates expression of respective target
TTGTAGTGAG genes whose function and utility is known in the art.

CTGAGATTGC GAM337130 is a novel bioinformatically detectable regulatory, non protein
ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337130 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCGATAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAAACTCC encoded by the human genome.

GAM337130 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337130 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337130 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337130 precursor RNA is designated SEQ ID:6609, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6609 is located from position 73327088 to position 73327176 relative to chromosome 15 on the `+` strand.

GAM337130 precursor RNA folds onto itself, forming GAM337130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337130 precursor RNA, designated SEQ ID NO: 6609, and a schematic representation of a predicted secondary folding of GAM337130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337130 folded precursor RNA yielding a GAM337130 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337130 RNA, hereby incorporated herein.

GAM337130 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337130 target RNA, herein designated GAM TARGET RNA.

GAM337130 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337130 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337130 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337130 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337130 RNA, herein designated GAM RNA, to target binding sites on GAM337130 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337130 target RNA into GAM337130 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337130 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337130 target genes. The mRNA of each one of this plurality of GAM337130 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337130 RNA, herein designated GAM RNA, and which when bound by GAM337130 RNA causes inhibition of translation of the GAM337130 target mRNA into a corresponding GAM337130 target protein.

The mechanism of the translational inhibition exerted by GAM337130 RNA, herein designated GAM RNA, on one or more GAM337130 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337130 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337130 RNA, herein designated GAM RNA, of GAM337130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337130 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337130 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337130 RNA correlate with, and may be deduced from, the identity of the GAM337130 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337131 7172 TGAGGCGCCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAAAACATA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCTGGGCTT Messenger 337131 (GAM337131) oligonucleotides modulates expression of respective target

GTGTGAGATG genes whose function and utility is known in the art.

GGAGAAAGAC GAM337131 is a novel bioinformatically detectable regulatory, non protein

CAGAAGTATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337131 was detected

GTCTAAACTT is described with additional reference to Figs. 9-15.

CTCCCTGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACACATCCAG encoded by the human genome.

CTTCATGGCA GAM337131 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTGTGCTACA GAM337131 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337131 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337131 precursor RNA is designated SEQ ID:7172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7172 is located from position 73549131 to position 73549240 relative to chromosome 17 on the `+` strand.

GAM337131 precursor RNA folds onto itself, forming GAM337131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337131 precursor RNA, designated SEQ ID NO: 7172, and a schematic representation of a predicted secondary folding of GAM337131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337131 folded precursor RNA yielding a GAM337131 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337131 RNA, hereby incorporated herein.

GAM337131 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337131 target RNA, herein designated GAM TARGET RNA.

GAM337131 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337131 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337131 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337131 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337131 RNA, herein designated GAM RNA, to target binding sites on GAM337131 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337131 target RNA into GAM337131 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM337131 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337131 target genes. The mRNA of each one of this plurality of GAM337131 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337131 RNA, herein designated GAM RNA, and which when bound by GAM337131 RNA causes inhibition of translation of the GAM337131 target mRNA into a corresponding GAM337131 target protein.

The mechanism of the translational inhibition exerted by GAM337131 RNA, herein designated GAM RNA, on one or more GAM337131 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337131 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337131 RNA, herein designated GAM RNA, of GAM337131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337131 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337131 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337131 RNA correlate with, and may be deduced from, the identity of the GAM337131 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337133 6018 CAGCGCGGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCGCCACCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAATAAATG Messenger 337133 (GAM337133) oligonucleotides modulates expression of respective target

TTGCTTGGAG genes whose function and utility is known in the art.

TGGACCGAGG GAM337133 is a novel bioinformatically detectable regulatory, non protein

CTCTGCAGGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337133 was detected

ATGCAGGGAG is described with additional reference to Figs. 9-15.

GGCCGGGCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGCCCCAGGG encoded by the human genome.

TTATTTCTAA GAM337133 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GTTGAGGACA GAM337133 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GGAGGTTGTG GAM337133 precursor RNA does not encode a protein. A nucleotide sequence identical or

AGTTCTGCTG highly similar to the nucleotide sequence of GAM337133 precursor RNA is designated SEQ

ID:6018, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6018 is located from position 73601903 to position 73602032 relative to chromosome 7 on the `+` strand.

GAM337133 precursor RNA folds onto itself, forming GAM337133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337133 precursor RNA, designated SEQ ID NO: 6018, and a schematic representation of a predicted secondary folding of GAM337133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337133 folded precursor RNA yielding a GAM337133 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337133 RNA, hereby incorporated herein.

GAM337133 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337133 target RNA, herein designated GAM TARGET RNA.

GAM337133 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337133 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337133 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337133 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337133 RNA, herein designated GAM RNA, to target binding sites on GAM337133 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337133 target RNA into GAM337133 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337133 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337133 target genes. The mRNA of each one of this plurality of GAM337133 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337133 RNA, herein designated GAM RNA, and which when bound by GAM337133 RNA causes inhibition of translation of the GAM337133 target mRNA into a corresponding GAM337133 target protein.

The mechanism of the translational inhibition exerted by GAM337133 RNA, herein designated GAM RNA, on one or more GAM337133 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337133 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337133 RNA, herein designated GAM RNA, of GAM337133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337133 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337133 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337133 RNA correlate with, and may be deduced from, the identity of the GAM337133 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CACCACTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CTCCAACCTG Messenger 337135 (GAM337135) oligonucleotides modulates expression of respective target

GACAACAGAG genes whose function and utility is known in the art.

CAAGACCCTG GAM337135 is a novel bioinformatically detectable regulatory, non protein
TCTCTAGGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337135 was detected
AGGTGCAGTG is described with additional reference to Figs. 9-15.

GCTCACACCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTAATCCCAG encoded by the human genome.

C GAM337135 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337135 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337135 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337135 precursor RNA is designated SEQ ID:6524, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6524 is located from position 73747698 to position 73747788 relative to chromosome 7 on the `+` strand.

GAM337135 precursor RNA folds onto itself, forming GAM337135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337135 precursor RNA, designated SEQ ID NO: 6524, and a schematic representation of a predicted secondary folding of GAM337135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337135 folded precursor RNA yielding a GAM337135 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337135 RNA, hereby incorporated herein.

GAM337135 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337135 target RNA, herein designated GAM TARGET RNA.

GAM337135 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337135 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337135 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337135 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337135 RNA, herein designated GAM RNA, to target binding sites on GAM337135 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337135 target RNA into GAM337135 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337135 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337135 target genes. The mRNA of each one of this plurality of GAM337135 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337135 RNA, herein designated GAM RNA, and which when bound by GAM337135 RNA causes inhibition of translation of the GAM337135 target mRNA into a corresponding GAM337135 target protein.

The mechanism of the translational inhibition exerted by GAM337135 RNA, herein designated GAM RNA, on one or more GAM337135 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337135 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337135 RNA, herein designated GAM RNA, of GAM337135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337135 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337135 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337135 RNA correlate with, and may be deduced from, the identity of the GAM337135 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGGGACTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337136 was detected

AGGGATTGCC is described with additional reference to Figs. 9-15.

CACGCTAGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATCTCACTGT encoded by the human genome.

ACAGCTGGAG GAM337136 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAACTGA GAM337136 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337136 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337136 precursor RNA is designated SEQ ID:6990, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6990 is located from position 73803663 to position 73803769 relative to chromosome 7 on the `+` strand.

GAM337136 precursor RNA folds onto itself, forming GAM337136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337136 precursor RNA, designated SEQ ID NO: 6990, and a schematic representation of a predicted secondary folding of GAM337136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337136 folded precursor RNA yielding a GAM337136 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337136 RNA, hereby incorporated herein.

GAM337136 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337136 target RNA, herein designated GAM TARGET RNA.

GAM337136 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337136 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337136 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337136 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337136 RNA, herein designated GAM RNA, to target binding sites on GAM337136 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337136 target RNA into GAM337136 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337136 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337136 target genes. The mRNA of each one of this plurality of GAM337136 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337136 RNA, herein designated GAM RNA, and which when bound by GAM337136 RNA causes inhibition of translation of the GAM337136 target mRNA into a corresponding GAM337136 target protein.

The mechanism of the translational inhibition exerted by GAM337136 RNA, herein designated GAM RNA, on one or more GAM337136 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337136 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337136 RNA, herein designated GAM RNA, of GAM337136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337136 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337136 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337136 RNA correlate with, and may be deduced from, the identity of the GAM337136 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337138 6348 GAGACCTCTA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGAGGCAGG Messenger 337138 (GAM337138) oligonucleotides modulates expression of respective target
AGTTGGCAAG genes whose function and utility is known in the art.

AGGTCAAGAC GAM337138 is a novel bioinformatically detectable regulatory, non protein
TGCAATGAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337138 was detected
CATGATCCTG is described with additional reference to Figs. 9-15.

CCACTATACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTGCCTGGG encoded by the human genome.

TGATGGGAGA GAM337138 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CCCTGTCTC GAM337138 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337138 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337138 precursor RNA is designated SEQ ID:6348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6348 is located from position 73912141 to position 73912249 relative to chromosome 9 on the `-` strand.

GAM337138 precursor RNA folds onto itself, forming GAM337138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337138 precursor RNA, designated SEQ ID NO: 6348, and a schematic representation of a predicted secondary folding of GAM337138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337138 folded precursor

RNA yielding a GAM337138 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337138 RNA, hereby incorporated herein.

GAM337138 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337138 target RNA, herein designated GAM TARGET RNA.

GAM337138 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337138 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337138 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337138 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337138 RNA, herein designated GAM RNA, to target binding sites on GAM337138 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337138 target RNA into GAM337138 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337138 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337138 target genes. The mRNA of each one of this plurality of GAM337138 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337138 RNA, herein designated GAM RNA, and which when bound by GAM337138 RNA causes inhibition of translation of the GAM337138 target mRNA into a corresponding GAM337138 target protein.

The mechanism of the translational inhibition exerted by GAM337138 RNA, herein designated GAM RNA, on one or more GAM337138 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337138 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337138 RNA, herein designated GAM RNA, of GAM337138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337138 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337138 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337138 RNA correlate with, and may be deduced from, the identity of the GAM337138 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337140 6019 CAGCGCGGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCGCCACCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAATAAATG Messenger 337140 (GAM337140) oligonucleotides modulates expression of respective target

TTGCTTGGAG genes whose function and utility is known in the art.

TGGACCGAGG GAM337140 is a novel bioinformatically detectable regulatory, non protein

CTCTGCAGGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337140 was detected

ATGCAGGGAG is described with additional reference to Figs. 9-15.

GGCCGGGCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGCCCCAGGG encoded by the human genome.

TTATTTCTAA GAM337140 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GTTGAGGACA GAM337140 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GGAGGTTGTG GAM337140 precursor RNA does not encode a protein. A nucleotide sequence identical or

AGTTCTGCTG highly similar to the nucleotide sequence of GAM337140 precursor RNA is designated SEQ

ID:6019, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6019 is located from position 73970646 to position 73970775 relative to chromosome 7 on the `-` strand.

GAM337140 precursor RNA folds onto itself, forming GAM337140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337140 precursor RNA, designated SEQ ID NO: 6019, and a schematic representation of a predicted secondary folding of GAM337140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337140 folded precursor RNA yielding a GAM337140 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337140 RNA, hereby incorporated herein.

GAM337140 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337140 target RNA, herein designated GAM TARGET RNA.

GAM337140 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337140 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337140 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337140 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337140 RNA, herein designated GAM RNA, to target binding sites on GAM337140 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337140 target RNA into GAM337140 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337140 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337140 target genes. The mRNA of each one of this plurality of GAM337140 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337140 RNA, herein designated GAM RNA, and which when bound by GAM337140 RNA causes inhibition of translation of the GAM337140 target mRNA into a corresponding GAM337140 target protein.

The mechanism of the translational inhibition exerted by GAM337140 RNA, herein designated GAM RNA, on one or more GAM337140 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337140 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337140 RNA, herein designated GAM RNA, of GAM337140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337140 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337140 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337140 RNA correlate with, and may be deduced from, the identity of the GAM337140 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337143 6525 GCTAGGATTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CACCACTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CTCCAACCTG Messenger 337143 (GAM337143) oligonucleotides modulates expression of respective target

GACAACAGAG genes whose function and utility is known in the art.

CAAGACCCTG GAM337143 is a novel bioinformatically detectable regulatory, non protein

TCTCTAGGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337143 was detected

AGGTGCAGTG is described with additional reference to Figs. 9-15.

GCTCACACCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTAATCCCAG encoded by the human genome.

C GAM337143 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337143 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337143 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337143 precursor RNA is designated SEQ ID:6525, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6525 is located from position 74080872 to position 74080962 relative to chromosome 7 on the `-` strand.

GAM337143 precursor RNA folds onto itself, forming GAM337143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337143 precursor RNA, designated SEQ ID NO: 6525, and a schematic representation of a predicted secondary folding of GAM337143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337143 folded precursor RNA yielding a GAM337143 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337143 RNA, hereby incorporated herein.

GAM337143 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337143 target RNA, herein designated GAM TARGET RNA.

GAM337143 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337143 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337143 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337143 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337143 RNA, herein designated GAM RNA, to target binding sites on GAM337143 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337143 target RNA into GAM337143 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337143 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337143 target genes. The mRNA of each one of this plurality of GAM337143 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337143 RNA, herein designated GAM RNA, and which when bound by GAM337143 RNA causes inhibition of translation of the GAM337143 target mRNA into a corresponding GAM337143 target protein.

The mechanism of the translational inhibition exerted by GAM337143 RNA, herein designated GAM RNA, on one or more GAM337143 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337143 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337143 RNA, herein designated GAM RNA, of GAM337143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337143 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337143 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337143 RNA correlate with, and may be deduced from, the identity of the GAM337143 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTGTGCAGGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337145 was detected

TGATGGGATC is described with additional reference to Figs. 9-15.

CAGCAGTGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CA encoded by the human genome.

GAM337145 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337145 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337145 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337145 precursor RNA is designated SEQ ID:7272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7272 is located from position 74141948 to position 74142029 relative to chromosome 16 on the `+` strand.

GAM337145 precursor RNA folds onto itself, forming GAM337145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337145 precursor RNA, designated SEQ ID NO: 7272, and a schematic representation of a predicted secondary folding of GAM337145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337145 folded precursor RNA yielding a GAM337145 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337145 RNA, hereby incorporated herein.

GAM337145 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337145 target RNA, herein designated GAM TARGET RNA.

GAM337145 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337145 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337145 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337145 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337145 RNA, herein designated GAM RNA, to target binding sites on GAM337145 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337145 target RNA into GAM337145 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337145 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337145 target genes. The mRNA of each one of this plurality of GAM337145 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337145 RNA, herein designated GAM RNA, and which when bound by GAM337145 RNA causes inhibition of translation of the GAM337145 target mRNA into a corresponding GAM337145 target protein.

The mechanism of the translational inhibition exerted by GAM337145 RNA, herein designated GAM RNA, on one or more GAM337145 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337145 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337145 RNA, herein designated GAM RNA, of GAM337145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337145 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337145 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337145 RNA correlate with, and may be deduced from, the identity of the GAM337145 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337146 7096 TGAGACAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACTCGGGCG Messenger 337146 (GAM337146) oligonucleotides modulates expression of respective target
GCGGAAGTTG genes whose function and utility is known in the art.

CAGTGAGCTG GAM337146 is a novel bioinformatically detectable regulatory, non protein
AGATTGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337146 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGTGAGAC encoded by the human genome.

TCTGTCTCA GAM337146 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337146 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337146 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337146 precursor RNA is designated SEQ ID:7096, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7096 is located from position 74273377 to position 74273475 relative to chromosome 2 on the `+` strand.

GAM337146 precursor RNA folds onto itself, forming GAM337146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337146 precursor RNA, designated SEQ ID NO: 7096, and a schematic representation of a predicted secondary folding of GAM337146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337146 folded precursor RNA yielding a GAM337146 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337146 RNA, hereby incorporated herein. Expression of GAM337146 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337146 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337146 target RNA, herein designated GAM TARGET RNA.

GAM337146 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337146 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337146 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337146 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337146 RNA, herein designated GAM RNA, to target binding sites on GAM337146 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337146 target RNA into GAM337146 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337146 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337146 target genes. The mRNA of each one of this plurality of GAM337146 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337146 RNA, herein designated GAM RNA, and which when bound by GAM337146 RNA causes inhibition of translation of the GAM337146 target mRNA into a corresponding GAM337146 target protein.

The mechanism of the translational inhibition exerted by GAM337146 RNA, herein designated GAM RNA, on one or more GAM337146 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337146 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337146 RNA, herein designated GAM RNA, of GAM337146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337146 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337146 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337146 RNA correlate with, and may be deduced from, the identity of the GAM337146 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337147 (GAM337147) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337147 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337147 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337147 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337147 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337147 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337147 precursor RNA is designated SEQ ID:6336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6336 is located from position 74273378 to position 74273474 relative to chromosome 2 on the `+` strand.

GAM337147 precursor RNA folds onto itself, forming GAM337147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337147 precursor RNA, designated SEQ ID NO: 6336, and a schematic representation of a predicted secondary folding of GAM337147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337147 folded precursor RNA yielding a GAM337147 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337147 RNA, hereby incorporated herein. Expression of GAM337147 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337147 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337147 target RNA, herein designated GAM TARGET RNA.

GAM337147 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337147 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337147 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337147 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337147 RNA, herein designated GAM RNA, to target binding sites on GAM337147 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337147 target RNA into GAM337147 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337147 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337147 target genes. The mRNA of each one of this plurality of GAM337147 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337147 RNA, herein designated GAM RNA, and which when bound by GAM337147 RNA causes inhibition of translation of the GAM337147 target mRNA into a corresponding GAM337147 target protein.

The mechanism of the translational inhibition exerted by GAM337147 RNA, herein designated GAM RNA, on one or more GAM337147 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337147 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337147 RNA, herein designated GAM RNA, of GAM337147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337147 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337147 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337147 RNA correlate with, and may be deduced from, the identity of the GAM337147 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337148 7059 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGGGCGGCG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAGTTGCAG Messenger 337148 (GAM337148) oligonucleotides modulates expression of respective target

TGAGCTGAGA genes whose function and utility is known in the art.

TTGCACCACT GAM337148 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337148 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

GTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337148 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337148 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337148 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337148 precursor RNA is designated SEQ ID:7059, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7059 is located from position 74273390 to position 74273463 relative to chromosome 2 on the `+` strand.

GAM337148 precursor RNA folds onto itself, forming GAM337148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337148 precursor RNA, designated SEQ ID NO: 7059, and a schematic representation of a predicted secondary folding of GAM337148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337148 folded precursor RNA yielding a GAM337148 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337148 RNA, hereby incorporated herein. Expression of GAM337148 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337148 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337148 target RNA, herein designated GAM TARGET RNA.

GAM337148 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337148 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337148 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337148 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337148 RNA, herein designated GAM RNA, to target binding sites on GAM337148 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337148 target RNA into GAM337148 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337148 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337148 target genes. The mRNA of each one of this plurality of GAM337148 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337148 RNA, herein designated GAM RNA, and which when bound by GAM337148 RNA causes inhibition of translation of the GAM337148 target mRNA into a corresponding GAM337148 target protein.

The mechanism of the translational inhibition exerted by GAM337148 RNA, herein

designated GAM RNA, on one or more GAM337148 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337148 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337148 RNA, herein designated GAM RNA, of GAM337148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337148 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337148 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337148 RNA correlate with, and may be deduced from, the identity of the GAM337148 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337149 5655 AAATTTTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAATTTTAC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCCCTAGAG Messenger 337149 (GAM337149) oligonucleotides modulates expression of respective target

GACTGGTTCT genes whose function and utility is known in the art.

AGCCACTTTC GAM337149 is a novel bioinformatically detectable regulatory, non protein

CCAGGGCAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337149 was detected

GGATCTCTGC is described with additional reference to Figs. 9-15.

AAAGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337149 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337149 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337149 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337149 precursor RNA is designated SEQ ID:5655, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5655 is located from position 74455579 to position 74455655

relative to chromosome 8 on the `+` strand.

GAM337149 precursor RNA folds onto itself, forming GAM337149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337149 precursor RNA, designated SEQ ID NO: 5655, and a schematic representation of a predicted secondary folding of GAM337149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337149 folded precursor RNA yielding a GAM337149 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337149 RNA, hereby incorporated herein.

GAM337149 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337149 target RNA, herein designated GAM TARGET RNA.

GAM337149 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337149 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337149 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337149 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337149 RNA, herein designated GAM RNA, to target binding sites on GAM337149 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337149 target RNA into GAM337149 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337149 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337149 target genes. The mRNA of each one of this plurality of GAM337149 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337149 RNA, herein designated GAM RNA, and which when bound by GAM337149 RNA causes inhibition of translation of the GAM337149 target mRNA into a corresponding GAM337149 target protein.

The mechanism of the translational inhibition exerted by GAM337149 RNA, herein designated GAM RNA, on one or more GAM337149 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337149 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337149 RNA, herein designated GAM RNA, of GAM337149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337149 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337149 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337149 RNA correlate with, and may be deduced from, the identity of the GAM337149 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCTCTAGGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337150 was detected
AGGTGCAGTG is described with additional reference to Figs. 9-15.

GCTCACACCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTAATCCCAG encoded by the human genome.

C GAM337150 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337150 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337150 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337150 precursor RNA is designated SEQ ID:6526, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6526 is located from position 74495125 to position 74495215 relative to chromosome 7 on the `-` strand.

GAM337150 precursor RNA folds onto itself, forming GAM337150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337150 precursor RNA, designated SEQ ID NO: 6526, and a schematic representation of a predicted secondary folding of GAM337150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337150 folded precursor RNA yielding a GAM337150 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337150 RNA, hereby incorporated herein.

GAM337150 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337150 target RNA, herein designated GAM TARGET RNA.

GAM337150 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337150 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337150 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337150 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337150 RNA, herein designated GAM RNA, to target

binding sites on GAM337150 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337150 target RNA into GAM337150 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337150 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337150 target genes. The mRNA of each one of this plurality of GAM337150 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337150 RNA, herein designated GAM RNA, and which when bound by GAM337150 RNA causes inhibition of translation of the GAM337150 target mRNA into a corresponding GAM337150 target protein.

The mechanism of the translational inhibition exerted by GAM337150 RNA, herein designated GAM RNA, on one or more GAM337150 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337150 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337150 RNA, herein designated GAM RNA, of GAM337150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337150 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337150 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337150 RNA correlate with, and may be deduced from, the identity of the GAM337150 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337151 6390 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCATTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTGGGAAG Messenger 337151 (GAM337151) oligonucleotides modulates expression of respective target

TGGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM337151 is a novel bioinformatically detectable regulatory, non protein

GATCGTGTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337151 was detected

CTGCACTCTA is described with additional reference to Figs. 9-15.

GCCTAGGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAAAGCGAGA encoded by the human genome.

CTCAGTCTC GAM337151 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337151 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337151 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337151 precursor RNA is designated SEQ ID:6390, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6390 is located from position 74600951 to position 74601049 relative to chromosome 7 on the `+` strand.

GAM337151 precursor RNA folds onto itself, forming GAM337151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337151 precursor RNA, designated SEQ ID NO: 6390, and a schematic representation of a predicted secondary folding of GAM337151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337151 folded precursor RNA yielding a GAM337151 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337151 RNA, hereby incorporated herein.

GAM337151 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337151 target RNA, herein designated GAM TARGET RNA.

GAM337151 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337151 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337151 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337151 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337151 RNA, herein designated GAM RNA, to target binding sites on GAM337151 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337151 target RNA into GAM337151 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337151 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337151 target genes. The mRNA of each one of this plurality of GAM337151 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337151 RNA, herein designated GAM RNA, and which when bound by GAM337151 RNA causes inhibition of translation of the GAM337151 target mRNA into a corresponding GAM337151 target protein.

The mechanism of the translational inhibition exerted by GAM337151 RNA, herein designated GAM RNA, on one or more GAM337151 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337151 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337151 RNA, herein designated GAM RNA, of GAM337151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337151 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337151 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337151 RNA correlate with, and may be deduced from, the identity of the GAM337151 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337152 6484 GCACAGTGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAAACAGAC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCCACCACAC Messenger 337152 (GAM337152) oligonucleotides modulates expression of respective target
CTTCTTGGCT genes whose function and utility is known in the art.

GTGCAAGGAA GAM337152 is a novel bioinformatically detectable regulatory, non protein
GTCAGATGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337152 was detected
GTTGGAGTCT is described with additional reference to Figs. 9-15.

GTGCTACTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GC encoded by the human genome.

GAM337152 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337152 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337152 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337152 precursor RNA is designated SEQ ID:6484, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6484 is located from position 74682720 to position 74682801 relative to chromosome 8 on the `-` strand.

GAM337152 precursor RNA folds onto itself, forming GAM337152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337152 precursor RNA, designated SEQ ID NO: 6484, and a schematic representation of a predicted secondary folding of GAM337152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337152 folded precursor RNA yielding a GAM337152 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337152 RNA, hereby incorporated herein.

GAM337152 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337152 target RNA, herein designated GAM TARGET RNA.

GAM337152 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337152 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337152 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337152 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337152 RNA, herein designated GAM RNA, to target binding sites on GAM337152 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337152 target RNA into GAM337152 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337152 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337152 target genes. The mRNA of each one of this plurality of GAM337152 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337152 RNA, herein designated GAM RNA, and which when bound by GAM337152 RNA causes inhibition of translation of the GAM337152 target mRNA into a corresponding GAM337152 target protein.

The mechanism of the translational inhibition exerted by GAM337152 RNA, herein designated GAM RNA, on one or more GAM337152 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337152 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337152 RNA, herein designated GAM RNA, of GAM337152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337152 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337152 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337152

RNA correlate with, and may be deduced from, the identity of the GAM337152 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337153 (GAM337153) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337153 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337153 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337153 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337153 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337153 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337153 precursor RNA is designated SEQ ID:6439, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6439 is located from position 74726081 to position 74726185 relative to chromosome 7 on the `-` strand.

GAM337153 precursor RNA folds onto itself, forming GAM337153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337153 precursor RNA, designated SEQ ID NO: 6439, and a schematic representation of a predicted secondary folding of GAM337153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337153 folded precursor RNA yielding a GAM337153 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337153 RNA, hereby incorporated herein.

GAM337153 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337153 target RNA, herein designated GAM TARGET RNA.

GAM337153 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337153 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337153 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337153 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337153 RNA, herein designated GAM RNA, to target binding sites on GAM337153 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337153 target RNA into GAM337153 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337153 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337153 target genes. The mRNA of each one of this plurality of GAM337153 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337153 RNA, herein designated GAM RNA, and which when bound by GAM337153 RNA causes inhibition of translation of the GAM337153 target mRNA into a corresponding GAM337153 target protein.

The mechanism of the translational inhibition exerted by GAM337153 RNA, herein designated GAM RNA, on one or more GAM337153 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337153 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337153 RNA, herein designated GAM RNA, of GAM337153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337153 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337153 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337153 RNA correlate with, and may be deduced from, the identity of the GAM337153 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337154 7133 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTGAGCTG GAM337154 is a novel bioinformatically detectable regulatory, non protein
AGATTGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337154 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGCGAG encoded by the human genome.

ACTCCATCTC GAM337154 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM337154 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337154 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337154 precursor RNA is designated SEQ ID:7133, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7133 is located from position 74733011 to position 74733111 relative to chromosome 10 on the `+` strand.

GAM337154 precursor RNA folds onto itself, forming GAM337154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337154 precursor RNA, designated SEQ ID NO: 7133, and a schematic representation of a predicted secondary folding of GAM337154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337154 folded precursor RNA yielding a GAM337154 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337154 RNA, hereby incorporated herein. Expression of GAM337154 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337154 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337154 target RNA, herein designated GAM TARGET RNA.

GAM337154 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337154 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337154 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337154 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337154 RNA, herein designated GAM RNA, to target binding sites on GAM337154 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337154 target RNA into GAM337154 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337154 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337154 target genes. The mRNA of each one of this plurality of GAM337154 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337154 RNA, herein designated GAM RNA, and which when bound by GAM337154 RNA causes inhibition of translation of the GAM337154 target mRNA into a corresponding GAM337154 target protein.

The mechanism of the translational inhibition exerted by GAM337154 RNA, herein designated GAM RNA, on one or more GAM337154 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337154 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337154 RNA, herein designated GAM RNA, of GAM337154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337154 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337154 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337154 RNA correlate with, and may be deduced from, the identity of the GAM337154 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGCGAGA encoded by the human genome.

CTCCATCTC GAM337155 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337155 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337155 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337155 precursor RNA is designated SEQ ID:6385, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6385 is located from position 74733012 to position 74733110 relative to chromosome 10 on the `+` strand.

GAM337155 precursor RNA folds onto itself, forming GAM337155 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337155 precursor RNA, designated SEQ ID NO: 6385, and a schematic representation of a predicted secondary folding of GAM337155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337155 folded precursor RNA yielding a GAM337155 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337155 RNA, hereby incorporated herein. Expression of GAM337155 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337155 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337155 target RNA, herein designated GAM TARGET RNA.

GAM337155 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337155 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337155 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337155 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337155 RNA, herein designated GAM RNA, to target binding sites on GAM337155 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337155 target RNA into GAM337155 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337155 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337155 target genes. The mRNA of each one of this

plurality of GAM337155 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337155 RNA, herein designated GAM RNA, and which when bound by GAM337155 RNA causes inhibition of translation of the GAM337155 target mRNA into a corresponding GAM337155 target protein.

The mechanism of the translational inhibition exerted by GAM337155 RNA, herein designated GAM RNA, on one or more GAM337155 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337155 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337155 RNA, herein designated GAM RNA, of GAM337155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337155 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337155 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337155 RNA correlate with, and may be deduced from, the identity of the GAM337155 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337156 6614 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 337156 (GAM337156) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGATTGC GAM337156 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337156 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM337156 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337156 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337156 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337156 precursor RNA is designated SEQ ID:6614, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6614 is located from position 74733018 to position 74733105 relative to chromosome 10 on the `+` strand.

GAM337156 precursor RNA folds onto itself, forming GAM337156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337156 precursor RNA, designated SEQ ID NO: 6614, and a schematic representation of a predicted secondary folding of GAM337156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337156 folded precursor RNA yielding a GAM337156 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337156 RNA, hereby incorporated herein. Expression of GAM337156 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337156 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337156 target RNA, herein designated GAM TARGET RNA.

GAM337156 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337156 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337156 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337156 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337156 RNA, herein designated GAM RNA, to target binding sites on GAM337156 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337156 target RNA into GAM337156 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337156 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337156 target genes. The mRNA of each one of this plurality of GAM337156 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337156 RNA, herein designated GAM RNA, and which when bound by GAM337156 RNA causes inhibition of translation of the GAM337156 target mRNA into a corresponding GAM337156 target protein.

The mechanism of the translational inhibition exerted by GAM337156 RNA, herein designated GAM RNA, on one or more GAM337156 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337156 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337156 RNA, herein designated GAM RNA, of GAM337156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337156 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337156 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337156 RNA correlate with, and may be deduced from, the identity of the GAM337156 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337157 6701 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCAGAGG Messenger 337157 (GAM337157) oligonucleotides modulates expression of respective target

TTGTGGTGAG genes whose function and utility is known in the art.

CTGAGATCGT GAM337157 is a novel bioinformatically detectable regulatory, non protein

CCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337157 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GTGACAGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAACTCC encoded by the human genome.

GAM337157 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337157 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337157 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337157 precursor RNA is designated SEQ ID:6701, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6701 is located from position 74841732 to position 74841819 relative to chromosome 17 on the `-` strand.

GAM337157 precursor RNA folds onto itself, forming GAM337157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337157 precursor RNA, designated SEQ ID NO: 6701, and a schematic representation of a predicted secondary folding of GAM337157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337157 folded precursor RNA yielding a GAM337157 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337157 RNA, hereby incorporated herein.

GAM337157 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337157 target RNA, herein designated GAM TARGET RNA.

GAM337157 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337157 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337157 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337157 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337157 RNA, herein designated GAM RNA, to target binding sites on GAM337157 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337157 target RNA into GAM337157 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337157 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337157 target genes. The mRNA of each one of this plurality of GAM337157 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337157 RNA, herein designated GAM RNA, and which when bound by GAM337157 RNA causes inhibition of translation of the GAM337157 target mRNA into a corresponding GAM337157 target protein.

The mechanism of the translational inhibition exerted by GAM337157 RNA, herein designated GAM RNA, on one or more GAM337157 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337157 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337157 RNA, herein designated GAM RNA, of GAM337157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337157 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337157 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337157 RNA correlate with, and may be deduced from, the identity of the GAM337157 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337158 6721 GGATGGTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGAAGAGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTGCATGGA Messenger 337158 (GAM337158) oligonucleotides modulates expression of respective target
TCGCTCAGAA genes whose function and utility is known in the art.

CTGACCCAGA GAM337158 is a novel bioinformatically detectable regulatory, non protein
GGCAATGAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337158 was detected
ATTTGTGTGC is described with additional reference to Figs. 9-15.

CATGTGGATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTCTCCAAAA encoded by the human genome.

TGTCC GAM337158 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337158 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337158 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337158 precursor RNA is designated SEQ ID:6721, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6721 is located from position 74959089 to position 74959183 relative to chromosome 15 on the `-` strand.

GAM337158 precursor RNA folds onto itself, forming GAM337158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337158 precursor RNA, designated SEQ ID NO: 6721, and a schematic representation of a predicted secondary folding of GAM337158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337158 folded precursor RNA yielding a GAM337158 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337158 RNA, hereby incorporated herein.

GAM337158 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337158 target RNA, herein designated GAM TARGET RNA.

GAM337158 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337158 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337158 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337158 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337158 RNA, herein designated GAM RNA, to target binding sites on GAM337158 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337158 target RNA into GAM337158 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337158 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337158 target genes. The mRNA of each one of this plurality of GAM337158 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337158 RNA, herein designated GAM RNA, and which when bound by GAM337158 RNA causes inhibition of translation of the GAM337158 target mRNA into a corresponding GAM337158 target protein.

The mechanism of the translational inhibition exerted by GAM337158 RNA, herein designated GAM RNA, on one or more GAM337158 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337158 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337158 RNA, herein designated GAM RNA, of GAM337158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337158 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337158 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337158 RNA correlate with, and may be deduced from, the identity of the GAM337158 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337159 5891 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337159 (GAM337159) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337159 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337159 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337159 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337159 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337159 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337159 precursor RNA is designated SEQ ID:5891, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5891 is located from position 75061068 to position 75061149 relative to chromosome 18 on the `-` strand.

GAM337159 precursor RNA folds onto itself, forming GAM337159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337159 precursor RNA, designated SEQ ID NO: 5891, and a schematic representation of a predicted secondary folding of GAM337159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337159 folded precursor RNA yielding a GAM337159 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337159 RNA, hereby incorporated herein.

GAM337159 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337159 target RNA, herein designated GAM TARGET RNA.

GAM337159 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337159 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337159 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337159 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337159 RNA, herein designated GAM RNA, to target binding sites on GAM337159 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337159 target RNA into GAM337159 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337159 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337159 target genes. The mRNA of each one of this plurality of GAM337159 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337159 RNA, herein designated GAM RNA, and which when bound by GAM337159 RNA causes inhibition of translation of the GAM337159 target mRNA into a corresponding GAM337159 target protein.

The mechanism of the translational inhibition exerted by GAM337159 RNA, herein designated GAM RNA, on one or more GAM337159 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337159 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337159 RNA, herein designated GAM RNA, of GAM337159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337159 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337159 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337159 RNA correlate with, and may be deduced from, the identity of the GAM337159 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GATCACACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337160 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGTGAGA encoded by the human genome.

CTTCATCTC GAM337160 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337160 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337160 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337160 precursor RNA is designated SEQ ID:6338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6338 is located from position 75203402 to position 75203500 relative to chromosome X on the `-` strand.

GAM337160 precursor RNA folds onto itself, forming GAM337160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337160 precursor RNA, designated SEQ ID NO: 6338, and a schematic representation of a predicted secondary folding of GAM337160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337160 folded precursor RNA yielding a GAM337160 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337160 RNA, hereby incorporated herein. Expression of GAM337160 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337160 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337160 target RNA, herein designated GAM TARGET RNA.

GAM337160 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337160 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337160 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337160 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337160 RNA, herein designated GAM RNA, to target binding sites on GAM337160 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337160 target RNA into GAM337160 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337160 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337160 target genes. The mRNA of each one of this plurality of GAM337160 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337160 RNA, herein designated GAM RNA, and which when bound by GAM337160 RNA causes inhibition of translation of the GAM337160 target mRNA into a corresponding GAM337160 target protein.

The mechanism of the translational inhibition exerted by GAM337160 RNA, herein designated GAM RNA, on one or more GAM337160 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337160 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337160 RNA, herein designated GAM RNA, of GAM337160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337160 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337160 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337160 RNA correlate with, and may be deduced from, the identity of the GAM337160 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337161 6937 GTTATGAAGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGTAGGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTAGCTCCA Messenger 337161 (GAM337161) oligonucleotides modulates expression of respective target

CAGGGTCAGA genes whose function and utility is known in the art.

CCTGCAGGTG GAM337161 is a novel bioinformatically detectable regulatory, non protein

CAAACAGGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337161 was detected

CTAGGCGAAC is described with additional reference to Figs. 9-15.

CCCCTGGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAACGTTGAC encoded by the human genome.

GAM337161 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337161 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337161 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337161 precursor RNA is designated SEQ ID:6937, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6937 is located from position 75209026 to position 75209115 relative to chromosome 14 on the `-` strand.

GAM337161 precursor RNA folds onto itself, forming GAM337161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337161 precursor RNA, designated SEQ ID NO: 6937, and a schematic representation of a predicted secondary folding of GAM337161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337161 folded precursor RNA yielding a GAM337161 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337161 RNA, hereby incorporated herein.

GAM337161 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337161 target RNA, herein designated GAM TARGET RNA.

GAM337161 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337161 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337161 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337161 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337161 RNA, herein designated GAM RNA, to target binding sites on GAM337161 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337161 target RNA into GAM337161 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337161 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337161 target genes. The mRNA of each one of this plurality of GAM337161 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337161 RNA, herein designated GAM RNA, and which when bound by GAM337161 RNA causes inhibition of translation of the GAM337161 target mRNA into a corresponding GAM337161 target protein.

The mechanism of the translational inhibition exerted by GAM337161 RNA, herein designated GAM RNA, on one or more GAM337161 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337161 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337161 RNA, herein designated GAM RNA, of GAM337161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337161 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337161 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337161 RNA correlate with, and may be deduced from, the identity of the GAM337161 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337162 6669 GGAGAATGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGC Messenger 337162 (GAM337162) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CAGAGATCAC GAM337162 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337162 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM337162 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337162 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337162 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337162 precursor RNA is designated SEQ

ID:6669, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6669 is located from position 75245669 to position 75245756 relative to chromosome 3 on the `-` strand.

GAM337162 precursor RNA folds onto itself, forming GAM337162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337162 precursor RNA, designated SEQ ID NO: 6669, and a schematic representation of a predicted secondary folding of GAM337162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337162 folded precursor RNA yielding a GAM337162 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337162 RNA, hereby incorporated herein. Expression of GAM337162 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337162 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337162 target RNA, herein designated GAM TARGET RNA.

GAM337162 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337162 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337162 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337162 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337162 RNA, herein designated GAM RNA, to target binding sites on GAM337162 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337162 target RNA

into GAM337162 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337162 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337162 target genes. The mRNA of each one of this plurality of GAM337162 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337162 RNA, herein designated GAM RNA, and which when bound by GAM337162 RNA causes inhibition of translation of the GAM337162 target mRNA into a corresponding GAM337162 target protein.

The mechanism of the translational inhibition exerted by GAM337162 RNA, herein designated GAM RNA, on one or more GAM337162 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337162 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337162 RNA, herein designated GAM RNA, of GAM337162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337162 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337162 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337162 RNA correlate with, and may be deduced from, the identity of the GAM337162 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337166 6440 GAGGCTGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTGCAATG GAM337166 is a novel bioinformatically detectable regulatory, non protein
AGCTATGATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337166 was detected
ATGCCACTGC is described with additional reference to Figs. 9-15.

ACTCCATCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGGAGCAGA encoded by the human genome.

GCTAGACTCT GAM337166 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GTCTC GAM337166 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337166 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337166 precursor RNA is designated SEQ ID:6440, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6440 is located from position 75764518 to position 75764622 relative to chromosome 7 on the `+` strand.

GAM337166 precursor RNA folds onto itself, forming GAM337166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337166 precursor RNA, designated SEQ ID NO: 6440, and a schematic representation of a predicted secondary folding of GAM337166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337166 folded precursor RNA yielding a GAM337166 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337166 RNA, hereby incorporated herein.

GAM337166 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337166 target RNA, herein designated GAM TARGET RNA.

GAM337166 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337166 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337166 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337166 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337166 RNA, herein designated GAM RNA, to target binding sites on GAM337166 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337166 target RNA into GAM337166 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337166 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337166 target genes. The mRNA of each one of this plurality of GAM337166 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337166 RNA, herein designated GAM RNA, and which when bound by GAM337166 RNA causes inhibition of translation of the GAM337166 target mRNA into a corresponding GAM337166 target protein.

The mechanism of the translational inhibition exerted by GAM337166 RNA, herein designated GAM RNA, on one or more GAM337166 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337166 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337166 RNA, herein designated GAM RNA, of GAM337166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337166 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337166 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337166 RNA correlate with, and may be deduced from, the identity of the GAM337166 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337167 6582 GGAATAAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGCAACGTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGCAGCTTC Messenger 337167 (GAM337167) oligonucleotides modulates expression of respective target

CAAATTTCTG genes whose function and utility is known in the art.

AAGAAACTAA GAM337167 is a novel bioinformatically detectable regulatory, non protein
TCTCAGATTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337167 was detected
GCAGTTAAAG is described with additional reference to Figs. 9-15.

TCAAAATGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCCAAATATT encoded by the human genome.

TATTCC GAM337167 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337167 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337167 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337167 precursor RNA is designated SEQ ID:6582, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6582 is located from position 75774294 to position 75774389 relative to chromosome 10 on the `-` strand.

GAM337167 precursor RNA folds onto itself, forming GAM337167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337167 precursor RNA, designated SEQ ID NO: 6582, and a schematic representation of a predicted secondary folding of GAM337167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337167 folded precursor RNA yielding a GAM337167 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337167 RNA, hereby incorporated herein.

GAM337167 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337167 target RNA, herein designated GAM TARGET RNA.

GAM337167 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337167 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337167 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337167 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337167 RNA, herein designated GAM RNA, to target binding sites on GAM337167 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337167 target RNA into GAM337167 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337167 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337167 target genes. The mRNA of each one of this plurality of GAM337167 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337167 RNA, herein designated GAM RNA, and which when bound by GAM337167 RNA causes inhibition of translation of the GAM337167 target mRNA into a corresponding GAM337167 target protein.

The mechanism of the translational inhibition exerted by GAM337167 RNA, herein designated GAM RNA, on one or more GAM337167 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337167 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337167 RNA, herein designated GAM RNA, of GAM337167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337167 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337167 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337167 RNA correlate with, and may be deduced from, the identity of the GAM337167 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CGCTCATGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGAGCTGTA encoded by the human genome.

GAC GAM337168 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337168 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337168 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337168 precursor RNA is designated SEQ ID:6890, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6890 is located from position 75794832 to position 75794924 relative to chromosome 7 on the `+` strand.

GAM337168 precursor RNA folds onto itself, forming GAM337168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337168 precursor RNA, designated SEQ ID NO: 6890, and a schematic representation of a predicted secondary folding of GAM337168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337168 folded precursor RNA yielding a GAM337168 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337168 RNA, hereby incorporated herein.

GAM337168 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337168 target RNA, herein designated GAM TARGET RNA.

GAM337168 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337168 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337168 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337168 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337168 RNA, herein designated GAM RNA, to target binding sites on GAM337168 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337168 target RNA into GAM337168 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337168 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337168 target genes. The mRNA of each one of this plurality of GAM337168 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337168 RNA, herein designated GAM RNA, and which when bound by GAM337168 RNA causes inhibition of translation of the GAM337168 target mRNA into a corresponding GAM337168 target protein.

The mechanism of the translational inhibition exerted by GAM337168 RNA, herein designated GAM RNA, on one or more GAM337168 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337168 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337168 RNA, herein designated GAM RNA, of GAM337168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337168 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337168 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337168 RNA correlate with, and may be deduced from, the identity of the GAM337168 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337169 6306 GAATGATTTG Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGGGGGCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TCAGAGAAGT Messenger 337169 (GAM337169) oligonucleotides modulates expression of respective target
AGGAATATCA genes whose function and utility is known in the art.

GGAGTGGTGG GAM337169 is a novel bioinformatically detectable regulatory, non protein
TCTGATTACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337169 was detected
CTGAGATGTG is described with additional reference to Figs. 9-15.

TCTTGATTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTTTGTTTT encoded by the human genome.

CTTTGAAATT GAM337169 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM337169 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337169 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337169 precursor RNA is designated SEQ ID:6306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6306 is located from position 75944727 to position 75944827 relative to chromosome 11 on the `+` strand.

GAM337169 precursor RNA folds onto itself, forming GAM337169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337169 precursor RNA, designated SEQ ID NO: 6306, and a schematic representation of a predicted secondary folding of GAM337169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337169 folded precursor

RNA yielding a GAM337169 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337169 RNA, hereby incorporated herein.

GAM337169 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337169 target RNA, herein designated GAM TARGET RNA.

GAM337169 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337169 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337169 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337169 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337169 RNA, herein designated GAM RNA, to target binding sites on GAM337169 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337169 target RNA into GAM337169 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337169 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337169 target genes. The mRNA of each one of this plurality of GAM337169 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337169 RNA, herein designated GAM RNA, and which when bound by GAM337169 RNA causes inhibition of translation of the GAM337169 target mRNA into a corresponding GAM337169 target protein.

The mechanism of the translational inhibition exerted by GAM337169 RNA, herein designated GAM RNA, on one or more GAM337169 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337169 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337169 RNA, herein designated GAM RNA, of GAM337169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337169 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337169 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337169 RNA correlate with, and may be deduced from, the identity of the GAM337169 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337170 6247 CTGTTGTTAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AACCTGCTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCACTGCTC Messenger 337170 (GAM337170) oligonucleotides modulates expression of respective target

AGCCTGCCAT genes whose function and utility is known in the art.

CAGCCATCCA GAM337170 is a novel bioinformatically detectable regulatory, non protein

GCTGCAGAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337170 was detected

AGTGGAGAGT is described with additional reference to Figs. 9-15.

AGGTCTCACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AG encoded by the human genome.

GAM337170 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337170 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337170 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337170 precursor RNA is designated SEQ ID:6247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6247 is located from position 76136262 to position 76136343 relative to chromosome 12 on the `+` strand.

GAM337170 precursor RNA folds onto itself, forming GAM337170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337170 precursor RNA, designated SEQ ID NO: 6247, and a schematic representation of a predicted secondary folding of GAM337170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337170 folded precursor RNA yielding a GAM337170 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337170 RNA, hereby incorporated herein.

GAM337170 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337170 target RNA, herein designated GAM TARGET RNA.

GAM337170 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337170 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337170 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337170 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337170 RNA, herein designated GAM RNA, to target binding sites on GAM337170 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337170 target RNA into GAM337170 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337170 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337170 target genes. The mRNA of each one of this plurality of GAM337170 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337170 RNA, herein designated GAM RNA, and which when bound by GAM337170 RNA causes inhibition of translation of the GAM337170 target mRNA into a corresponding GAM337170 target protein.

The mechanism of the translational inhibition exerted by GAM337170 RNA, herein designated GAM RNA, on one or more GAM337170 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337170 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337170 RNA, herein designated GAM RNA, of GAM337170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337170 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337170 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337170 RNA correlate with, and may be deduced from, the identity of the GAM337170 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337171 6441 GAGGCTGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTTGAGCCC Messenger 337171 (GAM337171) oligonucleotides modulates expression of respective target
AGGAATTAGA genes whose function and utility is known in the art.

GGCTGCAATG GAM337171 is a novel bioinformatically detectable regulatory, non protein
AGCTATGATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337171 was detected
ATGCCACTGC is described with additional reference to Figs. 9-15.

ACTCCATCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGGAGCAGA encoded by the human genome.

GCTAGACTCT GAM337171 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GTCTC GAM337171 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337171 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337171 precursor RNA is designated SEQ ID:6441, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6441 is located from position 76283582 to position 76283686 relative to chromosome 7 on the `+` strand.

GAM337171 precursor RNA folds onto itself, forming GAM337171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337171 precursor RNA, designated SEQ ID NO: 6441, and a schematic representation of a predicted secondary folding of GAM337171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337171 folded precursor RNA yielding a GAM337171 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337171 RNA, hereby incorporated herein.

GAM337171 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337171 target RNA, herein designated GAM TARGET RNA.

GAM337171 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337171 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337171 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337171 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337171 RNA, herein designated GAM RNA, to target binding sites on GAM337171 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337171 target RNA into GAM337171 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337171 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337171 target genes. The mRNA of each one of this

plurality of GAM337171 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337171 RNA, herein designated GAM RNA, and which when bound by GAM337171 RNA causes inhibition of translation of the GAM337171 target mRNA into a corresponding GAM337171 target protein.

The mechanism of the translational inhibition exerted by GAM337171 RNA, herein designated GAM RNA, on one or more GAM337171 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337171 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337171 RNA, herein designated GAM RNA, of GAM337171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337171 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337171 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337171 RNA correlate with, and may be deduced from, the identity of the GAM337171 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337172 7256 TGGTTGAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGACAAGTCT Messenger 337172 (GAM337172) oligonucleotides modulates expression of respective target

GGGCAACAAA genes whose function and utility is known in the art.

GTGAGATCCC GAM337172 is a novel bioinformatically detectable regulatory, non protein

ATCTCTACAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337172 was detected

AAAATTAGCC is described with additional reference to Figs. 9-15.

AGACTGGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTCCCTTAG encoded by the human genome.

CCTCAGCTA GAM337172 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337172 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337172 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337172 precursor RNA is designated SEQ ID:7256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7256 is located from position 76484385 to position 76484483 relative to chromosome 12 on the `+` strand.

GAM337172 precursor RNA folds onto itself, forming GAM337172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337172 precursor RNA, designated SEQ ID NO: 7256, and a schematic representation of a predicted secondary folding of GAM337172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337172 folded precursor RNA yielding a GAM337172 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337172 RNA, hereby incorporated herein.

GAM337172 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337172 target RNA, herein designated GAM TARGET RNA.

GAM337172 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337172 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337172 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337172 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337172 RNA, herein designated GAM RNA, to target binding sites on GAM337172 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337172 target RNA into GAM337172 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337172 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337172 target genes. The mRNA of each one of this plurality of GAM337172 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337172 RNA, herein designated GAM RNA, and which when bound by GAM337172 RNA causes inhibition of translation of the GAM337172 target mRNA into a corresponding GAM337172 target protein.

The mechanism of the translational inhibition exerted by GAM337172 RNA, herein designated GAM RNA, on one or more GAM337172 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337172 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337172 RNA, herein designated GAM RNA, of GAM337172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337172 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337172 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337172 RNA correlate with, and may be deduced from, the identity of the GAM337172 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337173 5991 CAATGGGGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGTTGAGAA Messenger 337173 (GAM337173) oligonucleotides modulates expression of respective target

TGCTGTAATT genes whose function and utility is known in the art.

GGAGGCCTGA GAM337173 is a novel bioinformatically detectable regulatory, non protein

GAGGTGGGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337173 was detected

CCAATTCTTA is described with additional reference to Figs. 9-15.

CATTTTCCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCACAAACT encoded by the human genome.

GTCTCCTTTT GAM337173 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

G GAM337173 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337173 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337173 precursor RNA is designated SEQ ID:5991, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5991 is located from position 76490700 to position 76490800 relative to chromosome 15 on the `-` strand.

GAM337173 precursor RNA folds onto itself, forming GAM337173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337173 precursor RNA, designated SEQ ID NO: 5991, and a schematic representation of a predicted secondary folding of GAM337173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337173 folded precursor RNA yielding a GAM337173 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337173 RNA, hereby incorporated herein.

GAM337173 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337173 target RNA, herein designated GAM TARGET RNA.

GAM337173 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337173 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337173 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337173 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337173 RNA, herein designated GAM RNA, to target binding sites on GAM337173 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337173 target RNA into GAM337173 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337173 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337173 target genes. The mRNA of each one of this plurality of GAM337173 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337173 RNA, herein designated GAM RNA, and which when bound by GAM337173 RNA causes inhibition of translation of the GAM337173 target mRNA into a corresponding GAM337173 target protein.

The mechanism of the translational inhibition exerted by GAM337173 RNA, herein designated GAM RNA, on one or more GAM337173 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337173 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337173 RNA, herein designated GAM RNA, of GAM337173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337173 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337173 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337173 RNA correlate with, and may be deduced from, the identity of the GAM337173 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337174 5815 AGTGGCAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGCAAATCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACTTGGCC Messenger 337174 (GAM337174) oligonucleotides modulates expression of respective target

TCCCAAACTA genes whose function and utility is known in the art.

AGGTACAAAG GAM337174 is a novel bioinformatically detectable regulatory, non protein
TTGTGAGTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337174 was detected

CACGTCTGCC is described with additional reference to Figs. 9-15.

ACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337174 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337174 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337174 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337174 precursor RNA is designated SEQ ID:5815, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5815 is located from position 76516598 to position 76516670 relative to chromosome 7 on the `+` strand.

GAM337174 precursor RNA folds onto itself, forming GAM337174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337174 precursor RNA, designated SEQ ID NO: 5815, and a schematic representation of a predicted secondary folding of GAM337174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337174 folded precursor RNA yielding a GAM337174 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337174 RNA, hereby incorporated herein.

GAM337174 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337174 target RNA, herein designated GAM TARGET RNA.

GAM337174 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337174 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337174 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337174 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337174 RNA, herein designated GAM RNA, to target binding sites on GAM337174 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337174 target RNA into GAM337174 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337174 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337174 target genes. The mRNA of each one of this plurality of GAM337174 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337174 RNA, herein designated GAM RNA, and which when bound by GAM337174 RNA causes inhibition of translation of the GAM337174 target mRNA into a corresponding GAM337174 target protein.

The mechanism of the translational inhibition exerted by GAM337174 RNA, herein designated GAM RNA, on one or more GAM337174 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337174 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337174 RNA, herein designated GAM RNA, of GAM337174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337174 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337174 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337174 RNA correlate with, and may be deduced from, the identity of the GAM337174 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337177 6805 GGGCTGACTT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGACTCTGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGTTAAGCA Messenger 337177 (GAM337177) oligonucleotides modulates expression of respective target
ACTTGCTCTC genes whose function and utility is known in the art.

CAGGAGTCCT GAM337177 is a novel bioinformatically detectable regulatory, non protein
GTGAAGAAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337177 was detected
TGCTTCATCC is described with additional reference to Figs. 9-15.

TTTTGAAGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCCC encoded by the human genome.

GAM337177 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337177 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337177 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337177 precursor RNA is designated SEQ ID:6805, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6805 is located from position 76741418 to position 76741502 relative to chromosome 17 on the `-` strand.

GAM337177 precursor RNA folds onto itself, forming GAM337177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337177 precursor RNA, designated SEQ ID NO: 6805, and a schematic representation of a predicted secondary folding of GAM337177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337177 folded precursor RNA yielding a GAM337177 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337177 RNA, hereby incorporated herein.

GAM337177 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337177 target RNA, herein designated GAM TARGET RNA.

GAM337177 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337177 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337177 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337177 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337177 RNA, herein designated GAM RNA, to target binding sites on GAM337177 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337177 target RNA into GAM337177 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337177 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337177 target genes. The mRNA of each one of this plurality of GAM337177 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337177 RNA, herein designated GAM RNA, and which when bound by GAM337177 RNA causes inhibition of translation of the GAM337177 target mRNA into a corresponding GAM337177 target protein.

The mechanism of the translational inhibition exerted by GAM337177 RNA, herein designated GAM RNA, on one or more GAM337177 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337177 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337177 RNA, herein designated GAM RNA, of GAM337177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337177 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337177 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337177 RNA correlate with, and may be deduced from, the identity of the GAM337177 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337179 7218 TGGAGCTGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTGGGCTGA GAM337179 is a novel bioinformatically detectable regulatory, non protein
GCACTGGTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337179 was detected
TTTCTGACTC is described with additional reference to Figs. 9-15.

ACAGCTCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGCCCA encoded by the human genome.

GAM337179 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337179 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337179 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337179 precursor RNA is designated SEQ ID:7218, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7218 is located from position 77038644 to position 77038729 relative to chromosome 11 on the `+` strand.

GAM337179 precursor RNA folds onto itself, forming GAM337179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337179 precursor RNA, designated SEQ ID NO: 7218, and a schematic representation of a predicted secondary folding of GAM337179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337179 folded precursor

RNA yielding a GAM337179 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337179 RNA, hereby incorporated herein.

GAM337179 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337179 target RNA, herein designated GAM TARGET RNA.

GAM337179 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337179 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337179 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337179 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337179 RNA, herein designated GAM RNA, to target binding sites on GAM337179 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337179 target RNA into GAM337179 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337179 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337179 target genes. The mRNA of each one of this plurality of GAM337179 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337179 RNA, herein designated GAM RNA, and which when bound by GAM337179 RNA causes inhibition of translation of the GAM337179 target mRNA into a corresponding GAM337179 target protein.

The mechanism of the translational inhibition exerted by GAM337179 RNA, herein designated GAM RNA, on one or more GAM337179 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337179 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337179 RNA, herein designated GAM RNA, of GAM337179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337179 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337179 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337179 RNA correlate with, and may be deduced from, the identity of the GAM337179 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337180 (GAM337180) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337180 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337180 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337180 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337180 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337180 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337180 precursor RNA is designated SEQ ID:6046, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6046 is located from position 77109458 to position 77109567 relative to chromosome 16 on the `+` strand.

GAM337180 precursor RNA folds onto itself, forming GAM337180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337180 precursor RNA, designated SEQ ID NO: 6046, and a schematic representation of a predicted secondary folding of GAM337180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337180 folded precursor RNA yielding a GAM337180 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337180 RNA, hereby incorporated herein.

GAM337180 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337180 target RNA, herein designated GAM TARGET RNA.

GAM337180 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337180 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337180 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337180 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337180 RNA, herein designated GAM RNA, to target binding sites on GAM337180 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337180 target RNA into GAM337180 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337180 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337180 target genes. The mRNA of each one of this plurality of GAM337180 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337180 RNA, herein designated GAM RNA, and which when bound by GAM337180 RNA causes inhibition of translation of the GAM337180 target mRNA into a corresponding GAM337180 target protein.

The mechanism of the translational inhibition exerted by GAM337180 RNA, herein designated GAM RNA, on one or more GAM337180 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337180 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337180 RNA, herein designated GAM RNA, of GAM337180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337180 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337180 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337180 RNA correlate with, and may be deduced from, the identity of the GAM337180 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GATTATGAGA Messenger 337181 (GAM337181) oligonucleotides modulates expression of respective target

AAGTTCTGCA genes whose function and utility is known in the art.

TGACTTAGCA GAM337181 is a novel bioinformatically detectable regulatory, non protein

TAACTGCTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337181 was detected

TTTCTAAAAG is described with additional reference to Figs. 9-15.

CCTCTGCAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAGATCCAAA encoded by the human genome.

GGGTTGGG GAM337181 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337181 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337181 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337181 precursor RNA is designated SEQ ID:6066, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6066 is located from position 77109464 to position 77109561

relative to chromosome 16 on the `+` strand.

GAM337181 precursor RNA folds onto itself, forming GAM337181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337181 precursor RNA, designated SEQ ID NO: 6066, and a schematic representation of a predicted secondary folding of GAM337181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337181 folded precursor RNA yielding a GAM337181 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337181 RNA, hereby incorporated herein.

GAM337181 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337181 target RNA, herein designated GAM TARGET RNA.

GAM337181 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337181 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337181 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337181 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337181 RNA, herein designated GAM RNA, to target binding sites on GAM337181 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337181 target RNA into GAM337181 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337181 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337181 target genes. The mRNA of each one of this plurality of GAM337181 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337181 RNA, herein designated GAM RNA, and which when bound by GAM337181 RNA causes inhibition of translation of the GAM337181 target mRNA into a corresponding GAM337181 target protein.

The mechanism of the translational inhibition exerted by GAM337181 RNA, herein designated GAM RNA, on one or more GAM337181 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337181 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337181 RNA, herein designated GAM RNA, of GAM337181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337181 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337181 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337181 RNA correlate with, and may be deduced from, the identity of the GAM337181 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337183 6694 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCAGAGG Messenger 337183 (GAM337183) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGATCAC GAM337183 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337183 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGAATCC encoded by the human genome.

GAM337183 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337183 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337183 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337183 precursor RNA is designated SEQ ID:6694, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6694 is located from position 77738565 to position 77738652 relative to chromosome 1 on the `+` strand.

GAM337183 precursor RNA folds onto itself, forming GAM337183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337183 precursor RNA, designated SEQ ID NO: 6694, and a schematic representation of a predicted secondary folding of GAM337183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337183 folded precursor RNA yielding a GAM337183 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337183 RNA, hereby incorporated herein. Expression of GAM337183 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337183 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337183 target RNA, herein designated GAM TARGET RNA.

GAM337183 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337183 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337183 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337183 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337183 RNA, herein designated GAM RNA, to target binding sites on GAM337183 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337183 target RNA into GAM337183 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337183 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337183 target genes. The mRNA of each one of this plurality of GAM337183 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337183 RNA, herein designated GAM RNA, and which when bound by GAM337183 RNA causes inhibition of translation of the GAM337183 target mRNA into a corresponding GAM337183 target protein.

The mechanism of the translational inhibition exerted by GAM337183 RNA, herein designated GAM RNA, on one or more GAM337183 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337183 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337183 RNA, herein designated GAM RNA, of GAM337183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337183 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337183 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337183 RNA correlate with, and may be deduced from, the identity of the GAM337183 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337184 6876 GTCCATCCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACATGAC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCCTGGTGTG Messenger 337184 (GAM337184) oligonucleotides modulates expression of respective target

TTAGTCTAGT genes whose function and utility is known in the art.

CTGTTCTCAT GAM337184 is a novel bioinformatically detectable regulatory, non protein
GCTGCTAATA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337184 was detected
AAGACATACC is described with additional reference to Figs. 9-15.

TGAGACTGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAATTTATAA encoded by the human genome.

AGGAAAGAGG GAM337184 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TTTAATGGAC GAM337184 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337184 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337184 precursor RNA is designated SEQ ID:6876, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6876 is located from position 78244320 to position 78244429 relative to chromosome 14 on the `+` strand.

GAM337184 precursor RNA folds onto itself, forming GAM337184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337184 precursor RNA, designated SEQ ID NO: 6876, and a schematic representation of a predicted secondary folding of GAM337184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337184 folded precursor RNA yielding a GAM337184 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337184 RNA, hereby incorporated herein.

GAM337184 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337184 target RNA, herein designated GAM TARGET RNA.

GAM337184 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337184 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337184 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337184 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337184 RNA, herein designated GAM RNA, to target binding sites on GAM337184 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337184 target RNA into GAM337184 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337184 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337184 target genes. The mRNA of each one of this plurality of GAM337184 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337184 RNA, herein designated GAM RNA, and which when bound by GAM337184 RNA causes inhibition of translation of the GAM337184 target mRNA into a corresponding GAM337184 target protein.

The mechanism of the translational inhibition exerted by GAM337184 RNA, herein designated GAM RNA, on one or more GAM337184 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337184 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337184 RNA, herein designated GAM RNA, of GAM337184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337184 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337184 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337184 RNA correlate with, and may be deduced from, the identity of the GAM337184 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337185 6395 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCCGGGAAG Messenger 337185 (GAM337185) oligonucleotides modulates expression of respective target
TGGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCCGA GAM337185 is a novel bioinformatically detectable regulatory, non protein
GATCTTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337185 was detected
TTGTTCTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGTGAA encoded by the human genome.

ACTCCATCTC GAM337185 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337185 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337185 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337185 precursor RNA is designated SEQ ID:6395, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6395 is located from position 78245362 to position 78245461 relative to chromosome 16 on the `+` strand.

GAM337185 precursor RNA folds onto itself, forming GAM337185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337185 precursor RNA, designated SEQ ID NO: 6395, and a schematic representation of a predicted secondary folding of GAM337185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337185 folded precursor RNA yielding a GAM337185 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337185 RNA, hereby incorporated herein.

GAM337185 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337185 target RNA, herein designated GAM TARGET RNA.

GAM337185 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337185 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337185 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337185 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337185 RNA, herein designated GAM RNA, to target binding sites on GAM337185 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337185 target RNA into GAM337185 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337185 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337185 target genes. The mRNA of each one of this plurality of GAM337185 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337185 RNA, herein designated GAM RNA, and which when bound by GAM337185 RNA causes inhibition of translation of the GAM337185 target mRNA into a corresponding GAM337185 target protein.

The mechanism of the translational inhibition exerted by GAM337185 RNA, herein designated GAM RNA, on one or more GAM337185 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337185 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337185 RNA, herein designated GAM RNA, of GAM337185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337185 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337185 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337185 RNA correlate with, and may be deduced from, the identity of the GAM337185 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCTT GAM337186 is a novel bioinformatically detectable regulatory, non protein
GCCATTGTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337186 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCGACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAAACTCC encoded by the human genome.

GAM337186 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337186 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337186 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337186 precursor RNA is designated SEQ ID:6644, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6644 is located from position 78245368 to position 78245456 relative to chromosome 16 on the `+` strand.

GAM337186 precursor RNA folds onto itself, forming GAM337186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337186 precursor RNA, designated SEQ ID NO: 6644, and a schematic representation of a predicted secondary folding of GAM337186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337186 folded precursor RNA yielding a GAM337186 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337186 RNA, hereby incorporated herein.

GAM337186 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337186 target RNA, herein designated GAM TARGET RNA.

GAM337186 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337186 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337186 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337186 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337186 RNA, herein designated GAM RNA, to target binding sites on GAM337186 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337186 target RNA into GAM337186 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337186 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337186 target genes. The mRNA of each one of this plurality of GAM337186 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337186 RNA, herein designated GAM RNA, and which when bound by GAM337186 RNA causes inhibition of translation of the GAM337186 target mRNA into a corresponding GAM337186 target protein.

The mechanism of the translational inhibition exerted by GAM337186 RNA, herein designated GAM RNA, on one or more GAM337186 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337186 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337186 RNA, herein designated GAM RNA, of GAM337186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337186 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337186 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337186 RNA correlate with, and may be deduced from, the identity of the GAM337186 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GACATGATTA is described with additional reference to Figs. 9-15.

ACTTGCAATA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTGTGACTC encoded by the human genome.

CCTC GAM337187 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337187 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337187 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337187 precursor RNA is designated SEQ ID:6446, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6446 is located from position 78638936 to position 78639029 relative to chromosome 16 on the `+` strand.

GAM337187 precursor RNA folds onto itself, forming GAM337187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337187 precursor RNA, designated SEQ ID NO: 6446, and a schematic representation of a predicted secondary folding of GAM337187 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337187 folded precursor RNA yielding a GAM337187 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337187 RNA, hereby incorporated herein.

GAM337187 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337187 target RNA, herein designated GAM TARGET RNA.

GAM337187 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337187 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337187 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337187 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337187 RNA, herein designated GAM RNA, to target binding sites on GAM337187 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337187 target RNA into GAM337187 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337187 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337187 target genes. The mRNA of each one of this plurality of GAM337187 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337187 RNA, herein designated GAM RNA, and which when bound by GAM337187 RNA causes inhibition of translation of the GAM337187 target mRNA into a corresponding GAM337187 target protein.

The mechanism of the translational inhibition exerted by GAM337187 RNA, herein designated GAM RNA, on one or more GAM337187 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337187 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337187 RNA, herein designated GAM RNA, of GAM337187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337187 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337187 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337187 RNA correlate with, and may be deduced from, the identity of the GAM337187 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337188 6759 GGCTAAGTCA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGAGAATTGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TTGAACCCAG Messenger 337188 (GAM337188) oligonucleotides modulates expression of respective target
GCATCGGAGG genes whose function and utility is known in the art.

TTGCAGTGAG GAM337188 is a novel bioinformatically detectable regulatory, non protein
CCGAGATTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337188 was detected
ACCAATGCAC is described with additional reference to Figs. 9-15.

TCCAGCCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCGACAGAGC encoded by the human genome.

GAGACTCCGT GAM337188 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
C GAM337188 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337188 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337188 precursor RNA is designated SEQ ID:6759, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6759 is located from position 78652714 to position 78652814 relative to chromosome 7 on the `+` strand.

GAM337188 precursor RNA folds onto itself, forming GAM337188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337188 precursor RNA, designated SEQ ID NO: 6759, and a schematic representation of a predicted secondary folding of GAM337188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337188 folded precursor RNA yielding a GAM337188 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337188 RNA, hereby incorporated herein.

GAM337188 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337188 target RNA, herein designated GAM TARGET RNA.

GAM337188 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337188 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337188 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337188 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337188 RNA, herein designated GAM RNA, to target binding sites on GAM337188 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337188 target RNA into GAM337188 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337188 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337188 target genes. The mRNA of each one of this plurality of GAM337188 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337188 RNA, herein designated GAM RNA, and which when bound by GAM337188 RNA causes inhibition of translation of the GAM337188 target mRNA into a corresponding GAM337188 target protein.

The mechanism of the translational inhibition exerted by GAM337188 RNA, herein designated GAM RNA, on one or more GAM337188 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337188 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337188 RNA, herein designated GAM RNA, of GAM337188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337188 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337188 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337188 RNA correlate with, and may be deduced from, the identity of the GAM337188 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337189 6330 GAGAATTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

CATCGGAGGT Messenger 337189 (GAM337189) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CGAGATTGCA GAM337189 is a novel bioinformatically detectable regulatory, non protein

CCAATGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337189 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CGACAGAGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGACTC encoded by the human genome.

GAM337189 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337189 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337189 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337189 precursor RNA is designated SEQ

ID:6330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6330 is located from position 78652725 to position 78652810 relative to chromosome 7 on the `+` strand.

GAM337189 precursor RNA folds onto itself, forming GAM337189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337189 precursor RNA, designated SEQ ID NO: 6330, and a schematic representation of a predicted secondary folding of GAM337189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337189 folded precursor RNA yielding a GAM337189 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337189 RNA, hereby incorporated herein.

GAM337189 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337189 target RNA, herein designated GAM TARGET RNA.

GAM337189 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337189 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337189 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337189 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337189 RNA, herein designated GAM RNA, to target binding sites on GAM337189 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337189 target RNA into GAM337189 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337189 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337189 target genes. The mRNA of each one of this plurality of GAM337189 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337189 RNA, herein designated GAM RNA, and which when bound by GAM337189 RNA causes inhibition of translation of the GAM337189 target mRNA into a corresponding GAM337189 target protein.

The mechanism of the translational inhibition exerted by GAM337189 RNA, herein designated GAM RNA, on one or more GAM337189 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337189 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337189 RNA, herein designated GAM RNA, of GAM337189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337189 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337189 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337189 RNA correlate with, and may be deduced from, the identity of the GAM337189 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337190 7306 TTCTGCTGTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TATTATGAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGACTGGCA Messenger 337190 (GAM337190) oligonucleotides modulates expression of respective target

CAGACATCTG genes whose function and utility is known in the art.

TCAAGGAAGA GAM337190 is a novel bioinformatically detectable regulatory, non protein

AGGATTCTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337190 was detected

GAGCGTATTT is described with additional reference to Figs. 9-15.

GTGTCAGTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACTGCATATA encoded by the human genome.

TGGACCACAA GAM337190 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CAGAA GAM337190 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337190 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337190 precursor RNA is designated SEQ ID:7306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7306 is located from position 78654888 to position 78654992 relative to chromosome 11 on the `-` strand.

GAM337190 precursor RNA folds onto itself, forming GAM337190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337190 precursor RNA, designated SEQ ID NO: 7306, and a schematic representation of a predicted secondary folding of GAM337190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337190 folded precursor RNA yielding a GAM337190 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337190 RNA, hereby incorporated herein.

GAM337190 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337190 target RNA, herein designated GAM TARGET RNA.

GAM337190 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337190 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337190 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337190 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337190 RNA, herein designated GAM RNA, to target binding sites on GAM337190 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337190 target RNA into GAM337190 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337190 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337190 target genes. The mRNA of each one of this plurality of GAM337190 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337190 RNA, herein designated GAM RNA, and which when bound by GAM337190 RNA causes inhibition of translation of the GAM337190 target mRNA into a corresponding GAM337190 target protein.

The mechanism of the translational inhibition exerted by GAM337190 RNA, herein designated GAM RNA, on one or more GAM337190 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337190 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337190 RNA, herein designated GAM RNA, of GAM337190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337190 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337190 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337190 RNA correlate with, and may be deduced from, the identity of the GAM337190 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337191 6835 GGTCAGTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAAGTGAAT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTACTCAGAG Messenger 337191 (GAM337191) oligonucleotides modulates expression of respective target

CTGTGAAATC genes whose function and utility is known in the art.

TTGGGGGAAT GAM337191 is a novel bioinformatically detectable regulatory, non protein
TTGACCCAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337191 was detected
CACAGTTGAG is described with additional reference to Figs. 9-15.

AGAAGGTTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGAAGGATAT encoded by the human genome.

GGGCT GAM337191 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337191 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337191 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337191 precursor RNA is designated SEQ ID:6835, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6835 is located from position 79303486 to position 79303580 relative to chromosome 11 on the `-` strand.

GAM337191 precursor RNA folds onto itself, forming GAM337191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337191 precursor RNA, designated SEQ ID NO: 6835, and a schematic representation of a predicted secondary folding of GAM337191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337191 folded precursor RNA yielding a GAM337191 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337191 RNA, hereby incorporated herein.

GAM337191 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337191 target RNA, herein designated GAM TARGET RNA.

GAM337191 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337191 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337191 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337191 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337191 RNA, herein designated GAM RNA, to target binding sites on GAM337191 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337191 target RNA into GAM337191 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337191 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337191 target genes. The mRNA of each one of this plurality of GAM337191 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337191 RNA, herein designated GAM RNA, and which when bound by GAM337191 RNA causes inhibition of translation of the GAM337191 target mRNA into a corresponding GAM337191 target protein.

The mechanism of the translational inhibition exerted by GAM337191 RNA, herein designated GAM RNA, on one or more GAM337191 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337191 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337191 RNA, herein designated GAM RNA, of GAM337191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337191 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337191 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337191 RNA correlate with, and may be deduced from, the identity of the GAM337191 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337192 5892 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337192 (GAM337192) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337192 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337192 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337192 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337192 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337192 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337192 precursor RNA is designated SEQ ID:5892, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5892 is located from position 79485331 to position 79485412 relative to chromosome 6 on the `+` strand.

GAM337192 precursor RNA folds onto itself, forming GAM337192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337192 precursor RNA, designated SEQ ID NO: 5892, and a schematic representation of a predicted secondary folding of GAM337192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337192 folded precursor RNA yielding a GAM337192 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337192 RNA, hereby incorporated herein.

GAM337192 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337192 target RNA, herein designated GAM TARGET RNA.

GAM337192 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337192 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337192 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337192 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337192 RNA, herein designated GAM RNA, to target binding sites on GAM337192 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337192 target RNA into GAM337192 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337192 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337192 target genes. The mRNA of each one of this plurality of GAM337192 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337192 RNA, herein designated GAM RNA, and which when bound by GAM337192 RNA causes inhibition of translation of the GAM337192 target mRNA into a corresponding GAM337192 target protein.

The mechanism of the translational inhibition exerted by GAM337192 RNA, herein designated GAM RNA, on one or more GAM337192 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337192 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337192 RNA, herein designated GAM RNA, of GAM337192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337192 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337192 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337192 RNA correlate with, and may be deduced from, the identity of the GAM337192 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337193 7033 TCCCTGTCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCTTCGAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTTGTTTTT Messenger 337193 (GAM337193) oligonucleotides modulates expression of respective target

AATGCTGGGT genes whose function and utility is known in the art.

GTCGATCGAG GAM337193 is a novel bioinformatically detectable regulatory, non protein

ACAACAAGCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337193 was detected

CTCAGAGCAA is described with additional reference to Figs. 9-15.

AGCAAGGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CATTACGGGG encoded by the human genome.

G GAM337193 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337193 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337193 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337193 precursor RNA is designated SEQ ID:7033, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7033 is located from position 79931894 to position 79931984 relative to chromosome 17 on the `-` strand.

GAM337193 precursor RNA folds onto itself, forming GAM337193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337193 precursor RNA, designated SEQ ID NO: 7033, and a schematic representation of a predicted secondary folding of GAM337193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337193 folded precursor RNA yielding a GAM337193 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337193 RNA, hereby incorporated herein.

GAM337193 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337193 target RNA, herein designated GAM TARGET RNA.

GAM337193 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337193 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337193 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337193 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337193 RNA, herein designated GAM RNA, to target binding sites on GAM337193 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337193 target RNA into GAM337193 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337193 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337193 target genes. The mRNA of each one of this plurality of GAM337193 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337193 RNA, herein designated GAM RNA, and which when bound by GAM337193 RNA causes inhibition of translation of the GAM337193 target mRNA into a corresponding GAM337193 target protein.

The mechanism of the translational inhibition exerted by GAM337193 RNA, herein designated GAM RNA, on one or more GAM337193 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337193 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337193 RNA, herein designated GAM RNA, of GAM337193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337193 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337193 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337193 RNA correlate with, and may be deduced from, the identity of the GAM337193 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337194 7205 TGCTGCATCC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCCTGGCTC detected oligonucleotides of the present invention, referred to here as Genomic Address
CCAGGAGGCC Messenger 337194 (GAM337194) oligonucleotides modulates expression of respective target
TCTCTCAGCA genes whose function and utility is known in the art.

TTTTCTGACA GAM337194 is a novel bioinformatically detectable regulatory, non protein
ACAAAGCCGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337194 was detected
GGCTGCAGAT is described with additional reference to Figs. 9-15.

CCCTGGTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTCCAGGCT encoded by the human genome.

AGCATCAGCA GAM337194 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337194 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337194 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337194 precursor RNA is designated SEQ ID:7205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7205 is located from position 80018909 to position 80019008 relative to chromosome 17 on the `+` strand.

GAM337194 precursor RNA folds onto itself, forming GAM337194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337194 precursor RNA, designated SEQ ID NO: 7205, and a schematic representation of a predicted secondary folding of GAM337194 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337194 folded precursor RNA yielding a GAM337194 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337194 RNA, hereby incorporated herein.

GAM337194 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337194 target RNA, herein designated GAM TARGET RNA.

GAM337194 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337194 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337194 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337194 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337194 RNA, herein designated GAM RNA, to target binding sites on GAM337194 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337194 target RNA into GAM337194 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337194 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337194 target genes. The mRNA of each one of this plurality of GAM337194 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337194 RNA, herein designated GAM RNA, and which when bound by GAM337194 RNA causes inhibition of translation of the GAM337194 target mRNA into a corresponding GAM337194 target protein.

The mechanism of the translational inhibition exerted by GAM337194 RNA, herein designated GAM RNA, on one or more GAM337194 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337194 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337194 RNA, herein designated GAM RNA, of GAM337194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337194 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337194 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337194 RNA correlate with, and may be deduced from, the identity of the GAM337194 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337195 6542 GCTGCATCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCTGGCTCC detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGGAGGCCT Messenger 337195 (GAM337195) oligonucleotides modulates expression of respective target

CTCTCAGCAT genes whose function and utility is known in the art.

TTTCTGACAA GAM337195 is a novel bioinformatically detectable regulatory, non protein

CAAAGCCGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337195 was detected

GCTGCAGATC is described with additional reference to Figs. 9-15.

CCTGGTGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTCCAGGCTA encoded by the human genome.

GCATCAGC GAM337195 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337195 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337195 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337195 precursor RNA is designated SEQ ID:6542, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6542 is located from position 80018910 to position 80019007 relative to chromosome 17 on the `+` strand.

GAM337195 precursor RNA folds onto itself, forming GAM337195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337195 precursor RNA, designated SEQ ID NO: 6542, and a schematic representation of a predicted secondary folding of GAM337195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337195 folded precursor RNA yielding a GAM337195 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337195 RNA, hereby incorporated herein.

GAM337195 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337195 target RNA, herein designated GAM TARGET RNA.

GAM337195 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337195 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337195 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337195 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337195 RNA, herein designated GAM RNA, to target binding sites on GAM337195 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337195 target RNA into GAM337195 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337195 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337195 target genes. The mRNA of each one of this plurality of GAM337195 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337195 RNA, herein designated GAM RNA, and which when bound by GAM337195 RNA causes inhibition of translation of the GAM337195 target mRNA into a corresponding GAM337195 target protein.

The mechanism of the translational inhibition exerted by GAM337195 RNA, herein designated GAM RNA, on one or more GAM337195 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337195 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337195 RNA, herein designated GAM RNA, of GAM337195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337195 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337195 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337195 RNA correlate with, and may be deduced from, the identity of the GAM337195 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337196 5893 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337196 (GAM337196) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337196 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337196 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337196 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337196 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337196 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337196 precursor RNA is designated SEQ

ID:5893, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5893 is located from position 80622214 to position 80622295 relative to chromosome 13 on the `+` strand.

GAM337196 precursor RNA folds onto itself, forming GAM337196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337196 precursor RNA, designated SEQ ID NO: 5893, and a schematic representation of a predicted secondary folding of GAM337196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337196 folded precursor RNA yielding a GAM337196 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337196 RNA, hereby incorporated herein.

GAM337196 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337196 target RNA, herein designated GAM TARGET RNA.

GAM337196 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337196 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337196 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337196 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337196 RNA, herein designated GAM RNA, to target binding sites on GAM337196 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337196 target RNA into GAM337196 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337196 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337196 target genes. The mRNA of each one of this plurality of GAM337196 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337196 RNA, herein designated GAM RNA, and which when bound by GAM337196 RNA causes inhibition of translation of the GAM337196 target mRNA into a corresponding GAM337196 target protein.

The mechanism of the translational inhibition exerted by GAM337196 RNA, herein designated GAM RNA, on one or more GAM337196 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337196 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337196 RNA, herein designated GAM RNA, of GAM337196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337196 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337196 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337196 RNA correlate with, and may be deduced from, the identity of the GAM337196 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337197 6702 GGAGAATTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAC detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGGCGGAGA Messenger 337197 (GAM337197) oligonucleotides modulates expression of respective target

CTGCGGTGAG genes whose function and utility is known in the art.

CTGATACCGC GAM337197 is a novel bioinformatically detectable regulatory, non protein

GTCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337197 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAAACTCC encoded by the human genome.

GAM337197 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337197 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337197 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337197 precursor RNA is designated SEQ ID:6702, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6702 is located from position 81064708 to position 81064796 relative to chromosome 17 on the `+` strand.

GAM337197 precursor RNA folds onto itself, forming GAM337197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337197 precursor RNA, designated SEQ ID NO: 6702, and a schematic representation of a predicted secondary folding of GAM337197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337197 folded precursor RNA yielding a GAM337197 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337197 RNA, hereby incorporated herein. Expression of GAM337197 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337197 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337197 target RNA, herein designated GAM TARGET RNA.

GAM337197 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337197 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337197 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337197 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337197 RNA, herein designated GAM RNA, to target binding sites on GAM337197 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337197 target RNA into GAM337197 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337197 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337197 target genes. The mRNA of each one of this plurality of GAM337197 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337197 RNA, herein designated GAM RNA, and which when bound by GAM337197 RNA causes inhibition of translation of the GAM337197 target mRNA into a corresponding GAM337197 target protein.

The mechanism of the translational inhibition exerted by GAM337197 RNA, herein designated GAM RNA, on one or more GAM337197 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337197 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337197 RNA, herein designated GAM RNA, of GAM337197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337197 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337197 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337197 RNA correlate with, and may be deduced from, the identity of the GAM337197 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337199 5786 AGGGAAAAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCATAATTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGACAGGCTC Messenger 337199 (GAM337199) oligonucleotides modulates expression of respective target

TCGGGGCTTC genes whose function and utility is known in the art.

ACCATACAAC GAM337199 is a novel bioinformatically detectable regulatory, non protein
GCCTTTCTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337199 was detected
TATTTGGTTA is described with additional reference to Figs. 9-15.

GTTTTATGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTGGAGTGT encoded by the human genome.

TGACCATGTA GAM337199 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TTAATTTTCT GAM337199 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CT GAM337199 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337199 precursor RNA is designated SEQ ID:5786, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5786 is located from position 81438779 to position 81438890 relative to chromosome 16 on the `+` strand.

GAM337199 precursor RNA folds onto itself, forming GAM337199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337199 precursor RNA, designated SEQ ID NO: 5786, and a schematic representation of a predicted secondary folding of GAM337199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337199 folded precursor RNA yielding a GAM337199 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337199 RNA, hereby incorporated herein.

GAM337199 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337199 target RNA, herein designated GAM TARGET RNA.

GAM337199 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337199 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337199 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337199 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337199 RNA, herein designated GAM RNA, to target binding sites on GAM337199 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337199 target RNA into GAM337199 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337199 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337199 target genes. The mRNA of each one of this plurality of GAM337199 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337199 RNA, herein designated GAM RNA, and which when bound by GAM337199 RNA causes inhibition of translation of the GAM337199 target mRNA into a corresponding GAM337199 target protein.

The mechanism of the translational inhibition exerted by GAM337199 RNA, herein designated GAM RNA, on one or more GAM337199 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337199 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337199 RNA, herein designated GAM RNA, of GAM337199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337199 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337199 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337199 RNA correlate with, and may be deduced from, the identity of the GAM337199 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337200 5729 AGAGGATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAGCCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GGAGGTCAAG Messenger 337200 (GAM337200) oligonucleotides modulates expression of respective target
GCTGCAGTGA genes whose function and utility is known in the art.

TCCATGATTG GAM337200 is a novel bioinformatically detectable regulatory, non protein
CGCCCCTGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337200 was detected
CTCTGGGCAA is described with additional reference to Figs. 9-15.

CAGAGCAAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCCT encoded by the human genome.

GAM337200 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337200 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337200 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337200 precursor RNA is designated SEQ ID:5729, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5729 is located from position 81629047 to position 81629130 relative to chromosome 8 on the `-` strand.

GAM337200 precursor RNA folds onto itself, forming GAM337200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337200 precursor RNA, designated SEQ ID NO: 5729, and a schematic representation of a predicted secondary folding of GAM337200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337200 folded precursor RNA yielding a GAM337200 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337200 RNA, hereby incorporated herein.

GAM337200 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337200 target RNA, herein designated GAM TARGET RNA.

GAM337200 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337200 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337200 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337200 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337200 RNA, herein designated GAM RNA, to target binding sites on GAM337200 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337200 target RNA into GAM337200 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337200 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337200 target genes. The mRNA of each one of this plurality of GAM337200 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337200 RNA, herein designated GAM RNA, and which when bound by GAM337200 RNA causes inhibition of translation of the GAM337200 target mRNA into a corresponding GAM337200 target protein.

The mechanism of the translational inhibition exerted by GAM337200 RNA, herein designated GAM RNA, on one or more GAM337200 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337200 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337200 RNA, herein designated GAM RNA, of GAM337200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337200 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337200 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337200 RNA correlate with, and may be deduced from, the identity of the GAM337200 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337202 6057 CCAGTATTGT Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGGGGAGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
TTTTGAGGTC Messenger 337202 (GAM337202) oligonucleotides modulates expression of respective target
ATCTAATGGT genes whose function and utility is known in the art.

GTTGTCTATT GAM337202 is a novel bioinformatically detectable regulatory, non protein
CTTCAGTAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337202 was detected
AACTCCAACA is described with additional reference to Figs. 9-15.

CCCTCTACAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGCTATCAC encoded by the human genome.

CACACAACCT GAM337202 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GG GAM337202 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337202 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337202 precursor RNA is designated SEQ ID:6057, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6057 is located from position 82178830 to position 82178931 relative to chromosome 7 on the `-` strand.

GAM337202 precursor RNA folds onto itself, forming GAM337202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337202 precursor RNA, designated SEQ ID NO: 6057, and a schematic representation of a predicted secondary folding of GAM337202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337202 folded precursor

RNA yielding a GAM337202 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337202 RNA, hereby incorporated herein.

GAM337202 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337202 target RNA, herein designated GAM TARGET RNA.

GAM337202 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337202 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337202 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337202 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337202 RNA, herein designated GAM RNA, to target binding sites on GAM337202 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337202 target RNA into GAM337202 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337202 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337202 target genes. The mRNA of each one of this plurality of GAM337202 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337202 RNA, herein designated GAM RNA, and which when bound by GAM337202 RNA causes inhibition of translation of the GAM337202 target mRNA into a corresponding GAM337202 target protein.

The mechanism of the translational inhibition exerted by GAM337202 RNA, herein designated GAM RNA, on one or more GAM337202 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337202 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337202 RNA, herein designated GAM RNA, of GAM337202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337202 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337202 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337202 RNA correlate with, and may be deduced from, the identity of the GAM337202 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337203 6648 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCAGAGG Messenger 337203 (GAM337203) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM337203 is a novel bioinformatically detectable regulatory, non protein

ACTACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337203 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM337203 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337203 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337203 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337203 precursor RNA is designated SEQ ID:6648, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6648 is located from position 82201058 to position 82201145 relative to chromosome 9 on the `+` strand.

GAM337203 precursor RNA folds onto itself, forming GAM337203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337203 precursor RNA, designated SEQ ID NO: 6648, and a schematic representation of a predicted secondary folding of GAM337203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337203 folded precursor RNA yielding a GAM337203 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337203 RNA, hereby incorporated herein. Expression of GAM337203 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337203 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337203 target RNA, herein designated GAM TARGET RNA.

GAM337203 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337203 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337203 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337203 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337203 RNA, herein designated GAM RNA, to target binding sites on GAM337203 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337203 target RNA into GAM337203 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337203 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337203 target genes. The mRNA of each one of this plurality of GAM337203 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337203 RNA, herein designated GAM RNA, and which when bound by GAM337203 RNA causes inhibition of translation of the GAM337203 target mRNA into a corresponding GAM337203 target protein.

The mechanism of the translational inhibition exerted by GAM337203 RNA, herein

designated GAM RNA, on one or more GAM337203 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337203 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337203 RNA, herein designated GAM RNA, of GAM337203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337203 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337203 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337203 RNA correlate with, and may be deduced from, the identity of the GAM337203 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337204 5894 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337204 (GAM337204) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337204 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337204 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337204 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337204 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337204 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337204 precursor RNA is designated SEQ ID:5894, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5894 is located from position 82464706 to position 82464787

relative to chromosome 9 on the `+` strand.

GAM337204 precursor RNA folds onto itself, forming GAM337204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337204 precursor RNA, designated SEQ ID NO: 5894, and a schematic representation of a predicted secondary folding of GAM337204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337204 folded precursor RNA yielding a GAM337204 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337204 RNA, hereby incorporated herein.

GAM337204 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337204 target RNA, herein designated GAM TARGET RNA.

GAM337204 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337204 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337204 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337204 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337204 RNA, herein designated GAM RNA, to target binding sites on GAM337204 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337204 target RNA into GAM337204 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337204 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337204 target genes. The mRNA of each one of this plurality of GAM337204 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337204 RNA, herein designated GAM RNA, and which when bound by GAM337204 RNA causes inhibition of translation of the GAM337204 target mRNA into a corresponding GAM337204 target protein.

The mechanism of the translational inhibition exerted by GAM337204 RNA, herein designated GAM RNA, on one or more GAM337204 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337204 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337204 RNA, herein designated GAM RNA, of GAM337204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337204 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337204 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337204 RNA correlate with, and may be deduced from, the identity of the GAM337204 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337206 5895 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337206 (GAM337206) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337206 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337206 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337206 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337206 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337206 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337206 precursor RNA is designated SEQ ID:5895, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5895 is located from position 83433939 to position 83434020 relative to chromosome 9 on the `-` strand.

GAM337206 precursor RNA folds onto itself, forming GAM337206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337206 precursor RNA, designated SEQ ID NO: 5895, and a schematic representation of a predicted secondary folding of GAM337206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337206 folded precursor RNA yielding a GAM337206 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337206 RNA, hereby incorporated herein.

GAM337206 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337206 target RNA, herein designated GAM TARGET RNA.

GAM337206 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337206 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337206 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337206 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337206 RNA, herein designated GAM RNA, to target

binding sites on GAM337206 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337206 target RNA into GAM337206 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337206 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337206 target genes. The mRNA of each one of this plurality of GAM337206 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337206 RNA, herein designated GAM RNA, and which when bound by GAM337206 RNA causes inhibition of translation of the GAM337206 target mRNA into a corresponding GAM337206 target protein.

The mechanism of the translational inhibition exerted by GAM337206 RNA, herein designated GAM RNA, on one or more GAM337206 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337206 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337206 RNA, herein designated GAM RNA, of GAM337206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337206 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337206 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337206 RNA correlate with, and may be deduced from, the identity of the GAM337206 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337207 7019 TCCACTACTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGTGGCTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCAAATTAC Messenger 337207 (GAM337207) oligonucleotides modulates expression of respective target

TAAATTTCTC genes whose function and utility is known in the art.

TGTGACTACT GAM337207 is a novel bioinformatically detectable regulatory, non protein

TTTCCATTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337207 was detected

TTAAGTAATT is described with additional reference to Figs. 9-15.

TGGTTGGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCAAAAGTCA encoded by the human genome.

ATAATGTGGA GAM337207 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337207 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337207 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337207 precursor RNA is designated SEQ ID:7019, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7019 is located from position 84223987 to position 84224086 relative to chromosome 7 on the `+` strand.

GAM337207 precursor RNA folds onto itself, forming GAM337207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337207 precursor RNA, designated SEQ ID NO: 7019, and a schematic representation of a predicted secondary folding of GAM337207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337207 folded precursor RNA yielding a GAM337207 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337207 RNA, hereby incorporated herein.

GAM337207 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337207 target RNA, herein designated GAM TARGET RNA.

GAM337207 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337207 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337207 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337207 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337207 RNA, herein designated GAM RNA, to target binding sites on GAM337207 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337207 target RNA into GAM337207 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337207 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337207 target genes. The mRNA of each one of this plurality of GAM337207 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337207 RNA, herein designated GAM RNA, and which when bound by GAM337207 RNA causes inhibition of translation of the GAM337207 target mRNA into a corresponding GAM337207 target protein.

The mechanism of the translational inhibition exerted by GAM337207 RNA, herein designated GAM RNA, on one or more GAM337207 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337207 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337207 RNA, herein designated GAM RNA, of GAM337207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337207 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337207 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337207 RNA correlate with, and may be deduced from, the identity of the GAM337207 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337208 6151 CTACTGTTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTTTTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
AATTACTAAA Messenger 337208 (GAM337208) oligonucleotides modulates expression of respective target
TTTCTCTGTG genes whose function and utility is known in the art.

ACTACTTTTC GAM337208 is a novel bioinformatically detectable regulatory, non protein
CATTTCTTAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337208 was detected
GTAATTTGGT is described with additional reference to Figs. 9-15.

TGGTTTCCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGTCAATAA encoded by the human genome.

TGTGG GAM337208 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337208 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337208 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337208 precursor RNA is designated SEQ ID:6151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6151 is located from position 84223991 to position 84224085 relative to chromosome 7 on the `+` strand.

GAM337208 precursor RNA folds onto itself, forming GAM337208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337208 precursor RNA, designated SEQ ID NO: 6151, and a schematic representation of a predicted secondary folding of GAM337208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337208 folded precursor RNA yielding a GAM337208 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337208 RNA, hereby incorporated herein.

GAM337208 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337208 target RNA, herein designated GAM TARGET RNA.

GAM337208 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337208 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337208 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337208 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337208 RNA, herein designated GAM RNA, to target binding sites on GAM337208 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337208 target RNA into GAM337208 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337208 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337208 target genes. The mRNA of each one of this plurality of GAM337208 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337208 RNA, herein designated GAM RNA, and which when bound by GAM337208 RNA causes inhibition of translation of the GAM337208 target mRNA into a corresponding GAM337208 target protein.

The mechanism of the translational inhibition exerted by GAM337208 RNA, herein designated GAM RNA, on one or more GAM337208 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337208 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337208 RNA, herein designated GAM RNA, of GAM337208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337208 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337208 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337208 RNA correlate with, and may be deduced from, the identity of the GAM337208 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337209 5896 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 337209 (GAM337209) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337209 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337209 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337209 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337209 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337209 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337209 precursor RNA is designated SEQ ID:5896, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5896 is located from position 84490971 to position 84491052 relative to chromosome 8 on the `-` strand.

GAM337209 precursor RNA folds onto itself, forming GAM337209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337209 precursor RNA, designated SEQ ID NO: 5896, and a schematic representation of a predicted secondary folding of GAM337209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337209 folded precursor RNA yielding a GAM337209 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337209 RNA, hereby incorporated herein.

GAM337209 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337209 target RNA, herein designated GAM TARGET RNA.

GAM337209 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337209 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337209 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337209 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337209 RNA, herein designated GAM RNA, to target binding sites on GAM337209 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337209 target RNA into GAM337209 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337209 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337209 target genes. The mRNA of each one of this plurality of GAM337209 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337209 RNA, herein designated GAM RNA, and which when bound by GAM337209 RNA causes inhibition of translation of the GAM337209 target mRNA into a corresponding GAM337209 target protein.

The mechanism of the translational inhibition exerted by GAM337209 RNA, herein designated GAM RNA, on one or more GAM337209 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337209 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337209 RNA, herein designated GAM RNA, of GAM337209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337209 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337209 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337209 RNA correlate with, and may be deduced from, the identity of the GAM337209 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337210 5897 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337210 (GAM337210) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337210 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337210 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337210 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337210 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337210 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337210 precursor RNA is designated SEQ ID:5897, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5897 is located from position 84536421 to position 84536502 relative to chromosome 5 on the `+` strand.

GAM337210 precursor RNA folds onto itself, forming GAM337210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337210 precursor RNA, designated SEQ ID NO: 5897, and a schematic representation of a predicted secondary folding of GAM337210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337210 folded precursor RNA yielding a GAM337210 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337210 RNA, hereby incorporated herein.

GAM337210 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337210 target RNA, herein designated GAM TARGET RNA.

GAM337210 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337210 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337210 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337210 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337210 RNA, herein designated GAM RNA, to target binding sites on GAM337210 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337210 target RNA into GAM337210 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337210 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337210 target genes. The mRNA of each one of this plurality of GAM337210 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337210 RNA, herein designated GAM RNA, and which when bound by GAM337210 RNA causes inhibition of translation of the GAM337210 target mRNA into a corresponding GAM337210 target protein.

The mechanism of the translational inhibition exerted by GAM337210 RNA, herein designated GAM RNA, on one or more GAM337210 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337210 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337210 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337210 RNA, herein designated GAM RNA, of GAM337210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337210 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337210 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337210 RNA correlate with, and may be deduced from, the identity of the GAM337210 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337211 5898 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337211 (GAM337211) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337211 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337211 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337211 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337211 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337211 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337211 precursor RNA is designated SEQ ID:5898, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5898 is located from position 84648170 to position 84648251 relative to chromosome 12 on the `-` strand.

GAM337211 precursor RNA folds onto itself, forming GAM337211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337211 precursor RNA, designated SEQ ID NO: 5898, and a schematic representation of a predicted secondary folding of GAM337211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337211 folded precursor RNA yielding a GAM337211 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337211 RNA, hereby incorporated herein.

GAM337211 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337211 target RNA, herein designated GAM TARGET RNA.

GAM337211 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337211 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337211 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337211 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337211 RNA, herein designated GAM RNA, to target binding sites on GAM337211 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337211 target RNA into GAM337211 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337211 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337211 target genes. The mRNA of each one of this plurality of GAM337211 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337211 RNA, herein designated GAM RNA, and which when bound by GAM337211 RNA causes inhibition of translation of the GAM337211 target mRNA into a corresponding GAM337211 target protein.

The mechanism of the translational inhibition exerted by GAM337211 RNA, herein

designated GAM RNA, on one or more GAM337211 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337211 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337211 RNA, herein designated GAM RNA, of GAM337211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337211 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337211 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337211 RNA correlate with, and may be deduced from, the identity of the GAM337211 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337212 5899 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337212 (GAM337212) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337212 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337212 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337212 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337212 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337212 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337212 precursor RNA is designated SEQ ID:5899, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5899 is located from position 84939391 to position 84939472

relative to chromosome 12 on the `+` strand.

GAM337212 precursor RNA folds onto itself, forming GAM337212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337212 precursor RNA, designated SEQ ID NO: 5899, and a schematic representation of a predicted secondary folding of GAM337212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337212 folded precursor RNA yielding a GAM337212 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337212 RNA, hereby incorporated herein.

GAM337212 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337212 target RNA, herein designated GAM TARGET RNA.

GAM337212 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337212 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337212 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337212 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337212 RNA, herein designated GAM RNA, to target binding sites on GAM337212 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337212 target RNA into GAM337212 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337212 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337212 target genes. The mRNA of each one of this plurality of GAM337212 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337212 RNA, herein designated GAM RNA, and which when bound by GAM337212 RNA causes inhibition of translation of the GAM337212 target mRNA into a corresponding GAM337212 target protein.

The mechanism of the translational inhibition exerted by GAM337212 RNA, herein designated GAM RNA, on one or more GAM337212 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337212 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337212 RNA, herein designated GAM RNA, of GAM337212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337212 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337212 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337212 RNA correlate with, and may be deduced from, the identity of the GAM337212 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337213 5772 AGGCAGGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCAGGAGGT Messenger 337213 (GAM337213) oligonucleotides modulates expression of respective target
GAAGGCTACA genes whose function and utility is known in the art.

GTGAAGTGAG GAM337213 is a novel bioinformatically detectable regulatory, non protein
ATCATGCAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337213 was detected
TGTACTTCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAGCAAGAT encoded by the human genome.

TCTCTTTCT GAM337213 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337213 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337213 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337213 precursor RNA is designated SEQ ID:5772, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5772 is located from position 85256084 to position 85256182 relative to chromosome 12 on the `+` strand.

GAM337213 precursor RNA folds onto itself, forming GAM337213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337213 precursor RNA, designated SEQ ID NO: 5772, and a schematic representation of a predicted secondary folding of GAM337213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337213 folded precursor RNA yielding a GAM337213 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337213 RNA, hereby incorporated herein.

GAM337213 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337213 target RNA, herein designated GAM TARGET RNA.

GAM337213 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337213 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337213 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337213 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337213 RNA, herein designated GAM RNA, to target binding sites on GAM337213 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337213 target RNA into GAM337213 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337213 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337213 target genes. The mRNA of each one of this plurality of GAM337213 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337213 RNA, herein designated GAM RNA, and which when bound by GAM337213 RNA causes inhibition of translation of the GAM337213 target mRNA into a corresponding GAM337213 target protein.

The mechanism of the translational inhibition exerted by GAM337213 RNA, herein designated GAM RNA, on one or more GAM337213 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337213 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337213 RNA, herein designated GAM RNA, of GAM337213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337213 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337213 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337213 RNA correlate with, and may be deduced from, the identity of the GAM337213 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337214 6710 GGAGGATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGAGCCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGAAGG Messenger 337214 (GAM337214) oligonucleotides modulates expression of respective target

CTACAGTGAA genes whose function and utility is known in the art.

GTGAGATCAT GAM337214 is a novel bioinformatically detectable regulatory, non protein

GCAACTGTAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337214 was detected

TTCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGATTCTCT encoded by the human genome.

GAM337214 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337214 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337214 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337214 precursor RNA is designated SEQ ID:6710, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6710 is located from position 85256089 to position 85256178 relative to chromosome 12 on the `+` strand.

GAM337214 precursor RNA folds onto itself, forming GAM337214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337214 precursor RNA, designated SEQ ID NO: 6710, and a schematic representation of a predicted secondary folding of GAM337214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337214 folded precursor RNA yielding a GAM337214 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337214 RNA, hereby incorporated herein.

GAM337214 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337214 target RNA, herein designated GAM TARGET RNA.

GAM337214 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337214 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337214 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337214 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337214 RNA, herein designated GAM RNA, to target binding sites on GAM337214 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337214 target RNA into GAM337214 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337214 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337214 target genes. The mRNA of each one of this plurality of GAM337214 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337214 RNA, herein designated GAM RNA, and which when bound by GAM337214 RNA causes inhibition of translation of the GAM337214 target mRNA into a corresponding GAM337214 target protein.

The mechanism of the translational inhibition exerted by GAM337214 RNA, herein designated GAM RNA, on one or more GAM337214 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337214 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337214 RNA, herein designated GAM RNA, of GAM337214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337214 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337214 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337214 RNA correlate with, and may be deduced from, the identity of the GAM337214 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337215 6366 GAGGATCACG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGTGAAGGC Messenger 337215 (GAM337215) oligonucleotides modulates expression of respective target
TACAGTGAAG genes whose function and utility is known in the art.

TGAGATCATG GAM337215 is a novel bioinformatically detectable regulatory, non protein
CAACTGTACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337215 was detected
TCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGATTCTC encoded by the human genome.

GAM337215 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337215 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337215 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337215 precursor RNA is designated SEQ ID:6366, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6366 is located from position 85256090 to position 85256177 relative to chromosome 12 on the `+` strand.

GAM337215 precursor RNA folds onto itself, forming GAM337215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337215 precursor RNA, designated SEQ ID NO: 6366, and a schematic representation of a predicted secondary folding of GAM337215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337215 folded precursor RNA yielding a GAM337215 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337215 RNA, hereby incorporated herein.

GAM337215 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337215 target RNA, herein designated GAM TARGET RNA.

GAM337215 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337215 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337215 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337215 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337215 RNA, herein designated GAM RNA, to target binding sites on GAM337215 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337215 target RNA into GAM337215 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337215 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337215 target genes. The mRNA of each one of this plurality of GAM337215 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337215 RNA, herein designated GAM RNA, and which when bound by GAM337215 RNA causes inhibition of translation of the GAM337215 target mRNA into a corresponding GAM337215 target protein.

The mechanism of the translational inhibition exerted by GAM337215 RNA, herein designated GAM RNA, on one or more GAM337215 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337215 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337215 RNA, herein designated GAM RNA, of GAM337215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337215 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337215 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337215

RNA correlate with, and may be deduced from, the identity of the GAM337215 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337216 (GAM337216) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337216 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337216 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337216 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337216 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337216 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337216 precursor RNA is designated SEQ ID:5900, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5900 is located from position 85369298 to position 85369379 relative to chromosome 7 on the `-` strand.

GAM337216 precursor RNA folds onto itself, forming GAM337216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337216 precursor RNA, designated SEQ ID NO: 5900, and a schematic representation of a predicted secondary folding of GAM337216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337216 folded precursor RNA yielding a GAM337216 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337216 RNA, hereby incorporated herein.

GAM337216 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337216 target RNA, herein designated GAM TARGET RNA.

GAM337216 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337216 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337216 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337216 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337216 RNA, herein designated GAM RNA, to target binding sites on GAM337216 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337216 target RNA into GAM337216 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337216 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337216 target genes. The mRNA of each one of this plurality of GAM337216 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337216 RNA, herein designated GAM RNA, and which when bound by GAM337216 RNA causes inhibition of translation of the GAM337216 target mRNA into a corresponding GAM337216 target protein.

The mechanism of the translational inhibition exerted by GAM337216 RNA, herein designated GAM RNA, on one or more GAM337216 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337216 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337216 RNA, herein designated GAM RNA, of GAM337216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337216 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337216 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337216 RNA correlate with, and may be deduced from, the identity of the GAM337216 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337217 6091 CCCTGTCAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATATGCTTGT Messenger 337217 (GAM337217) oligonucleotides modulates expression of respective target
TGGAGATCCT genes whose function and utility is known in the art.

TCAGGCAGTA GAM337217 is a novel bioinformatically detectable regulatory, non protein
AGGGAGAGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337217 was detected
TTGCCTCCTT is described with additional reference to Figs. 9-15.

ACACAGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337217 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337217 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337217 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337217 precursor RNA is designated SEQ ID:6091, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6091 is located from position 86608510 to position 86608588 relative to chromosome 15 on the `+` strand.

GAM337217 precursor RNA folds onto itself, forming GAM337217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337217 precursor RNA, designated SEQ ID NO: 6091, and a schematic representation of a predicted secondary folding of GAM337217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337217 folded precursor RNA yielding a GAM337217 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337217 RNA, hereby incorporated herein.

GAM337217 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337217 target RNA, herein designated GAM TARGET RNA.

GAM337217 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337217 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337217 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337217 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337217 RNA, herein designated GAM RNA, to target binding sites on GAM337217 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337217 target RNA into GAM337217 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337217 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337217 target genes. The mRNA of each one of this plurality of GAM337217 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337217 RNA, herein designated GAM RNA, and which when bound by GAM337217 RNA causes inhibition of translation of the GAM337217 target mRNA into a corresponding GAM337217 target protein.

The mechanism of the translational inhibition exerted by GAM337217 RNA, herein designated GAM RNA, on one or more GAM337217 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337217 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337217 RNA, herein designated GAM RNA, of GAM337217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337217 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337217 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337217 RNA correlate with, and may be deduced from, the identity of the GAM337217 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337218 5774 AGGCCATCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAGATGACA Messenger 337218 (GAM337218) oligonucleotides modulates expression of respective target

CTCTCCCCCT genes whose function and utility is known in the art.

GTAACTCAGC GAM337218 is a novel bioinformatically detectable regulatory, non protein

CTGGCTCTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337218 was detected

CTATTGGGAT is described with additional reference to Figs. 9-15.

GTGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337218 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337218 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337218 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337218 precursor RNA is designated SEQ ID:5774, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5774 is located from position 86923030 to position 86923105 relative to chromosome 14 on the `+` strand.

GAM337218 precursor RNA folds onto itself, forming GAM337218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337218 precursor RNA, designated SEQ ID NO: 5774, and a schematic representation of a predicted secondary folding of GAM337218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337218 folded precursor RNA yielding a GAM337218 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337218 RNA, hereby incorporated herein.

GAM337218 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337218 target RNA, herein designated GAM TARGET RNA.

GAM337218 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337218 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337218 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337218 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337218 RNA, herein designated GAM RNA, to target binding sites on GAM337218 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337218 target RNA into GAM337218 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337218 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337218 target genes. The mRNA of each one of this plurality of GAM337218 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337218 RNA, herein designated GAM RNA, and which when bound by GAM337218 RNA causes inhibition of translation of the GAM337218 target mRNA into a corresponding GAM337218 target protein.

The mechanism of the translational inhibition exerted by GAM337218 RNA, herein designated GAM RNA, on one or more GAM337218 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337218 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337218 RNA, herein designated GAM RNA, of GAM337218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337218 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337218 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337218 RNA correlate with, and may be deduced from, the identity of the GAM337218 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGCTGGGCT Messenger 337220 (GAM337220) oligonucleotides modulates expression of respective target

GAGACAATTA genes whose function and utility is known in the art.

ATGTCTGTCA GAM337220 is a novel bioinformatically detectable regulatory, non protein

GCCCAAACCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337220 was detected

GGCACTCTGA is described with additional reference to Figs. 9-15.

CCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337220 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337220 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337220 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337220 precursor RNA is designated SEQ ID:6315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6315 is located from position 87035430 to position 87035503 relative to chromosome 15 on the `+` strand.

GAM337220 precursor RNA folds onto itself, forming GAM337220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337220 precursor RNA, designated SEQ ID NO: 6315, and a schematic representation of a predicted secondary folding of GAM337220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337220 folded precursor RNA yielding a GAM337220 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337220 RNA, hereby incorporated herein.

GAM337220 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337220 target RNA, herein designated GAM TARGET RNA.

GAM337220 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337220 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337220 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337220 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337220 RNA, herein designated GAM RNA, to target binding sites on GAM337220 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337220 target RNA into GAM337220 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337220 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337220 target genes. The mRNA of each one of this

plurality of GAM337220 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337220 RNA, herein designated GAM RNA, and which when bound by GAM337220 RNA causes inhibition of translation of the GAM337220 target mRNA into a corresponding GAM337220 target protein.

The mechanism of the translational inhibition exerted by GAM337220 RNA, herein designated GAM RNA, on one or more GAM337220 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337220 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337220 RNA, herein designated GAM RNA, of GAM337220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337220 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337220 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337220 RNA correlate with, and may be deduced from, the identity of the GAM337220 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGCTATGAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCCAGTCTAG encoded by the human genome.

GCCTGCGCC GAM337221 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337221 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337221 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337221 precursor RNA is designated SEQ ID:6830, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6830 is located from position 87449030 to position 87449128 relative to chromosome 10 on the `-` strand.

GAM337221 precursor RNA folds onto itself, forming GAM337221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337221 precursor RNA, designated SEQ ID NO: 6830, and a schematic representation of a predicted secondary folding of GAM337221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337221 folded precursor RNA yielding a GAM337221 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337221 RNA, hereby incorporated herein.

GAM337221 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337221 target RNA, herein designated GAM TARGET RNA.

GAM337221 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337221 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337221 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337221 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337221 RNA, herein designated GAM RNA, to target binding sites on GAM337221 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337221 target RNA into GAM337221 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337221 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337221 target genes. The mRNA of each one of this plurality of GAM337221 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337221 RNA, herein designated GAM RNA, and which when bound by GAM337221 RNA causes inhibition of translation of the GAM337221 target mRNA into a corresponding GAM337221 target protein.

The mechanism of the translational inhibition exerted by GAM337221 RNA, herein designated GAM RNA, on one or more GAM337221 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337221 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337221 RNA, herein designated GAM RNA, of GAM337221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337221 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337221 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337221 RNA correlate with, and may be deduced from, the identity of the GAM337221 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337224 5901 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337224 (GAM337224) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337224 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337224 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337224 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337224 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337224 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337224 precursor RNA is designated SEQ ID:5901, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5901 is located from position 88198417 to position 88198498 relative to chromosome 7 on the `-` strand.

GAM337224 precursor RNA folds onto itself, forming GAM337224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337224 precursor RNA, designated SEQ ID NO: 5901, and a schematic representation of a predicted secondary folding of GAM337224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337224 folded precursor RNA yielding a GAM337224 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337224 RNA, hereby incorporated herein.

GAM337224 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337224 target RNA, herein designated GAM TARGET RNA.

GAM337224 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337224 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337224 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337224 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337224 RNA, herein designated GAM RNA, to target binding sites on GAM337224 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337224 target RNA into GAM337224 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337224 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337224 target genes. The mRNA of each one of this plurality of GAM337224 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337224 RNA, herein designated GAM RNA, and which when bound by GAM337224 RNA causes inhibition of translation of the GAM337224 target mRNA into a corresponding GAM337224 target protein.

The mechanism of the translational inhibition exerted by GAM337224 RNA, herein designated GAM RNA, on one or more GAM337224 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337224 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337224 RNA, herein designated GAM RNA, of GAM337224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337224 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337224 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337224 RNA correlate with, and may be deduced from, the identity of the GAM337224 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337225 6196 CTGAGAGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGCTTCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAGCCGAGG Messenger 337225 (GAM337225) oligonucleotides modulates expression of respective target

CCACACCACT genes whose function and utility is known in the art.

GCACTCCGGC GAM337225 is a novel bioinformatically detectable regulatory, non protein
CTTGGTGACA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337225 was detected
GAGACTCTGC is described with additional reference to Figs. 9-15.

CTCGAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337225 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337225 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337225 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337225 precursor RNA is designated SEQ ID:6196, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6196 is located from position 88408163 to position 88408240 relative to chromosome 15 on the `+` strand.

GAM337225 precursor RNA folds onto itself, forming GAM337225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337225 precursor RNA, designated SEQ ID NO: 6196, and a schematic representation of a predicted secondary folding of GAM337225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337225 folded precursor RNA yielding a GAM337225 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337225 RNA, hereby incorporated herein.

GAM337225 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337225 target RNA, herein designated GAM TARGET RNA.

GAM337225 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337225 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337225 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337225 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337225 RNA, herein designated GAM RNA, to target binding sites on GAM337225 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337225 target RNA into GAM337225 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337225 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337225 target genes. The mRNA of each one of this plurality of GAM337225 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337225 RNA, herein designated GAM RNA, and which when bound by GAM337225 RNA causes inhibition of translation of the GAM337225 target mRNA into a corresponding GAM337225 target protein.

The mechanism of the translational inhibition exerted by GAM337225 RNA, herein designated GAM RNA, on one or more GAM337225 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337225 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337225 RNA, herein designated GAM RNA, of GAM337225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337225 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337225 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337225 RNA correlate with, and may be deduced from, the identity of the GAM337225 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337226 6868 GTATAACGCA Fig. 8 further provides a conceptual description of another novel bioinformatically
AAACACAATT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTAAATAGT Messenger 337226 (GAM337226) oligonucleotides modulates expression of respective target
CAAAAGTTTT genes whose function and utility is known in the art.

TCCTGGCAAG GAM337226 is a novel bioinformatically detectable regulatory, non protein
GAGACTTTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337226 was detected
TAGACACCTA is described with additional reference to Figs. 9-15.

CCCTGTGATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATCTGTGTGC encoded by the human genome.

GAM337226 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337226 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337226 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337226 precursor RNA is designated SEQ ID:6868, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6868 is located from position 88578225 to position 88578314 relative to chromosome 9 on the `+` strand.

GAM337226 precursor RNA folds onto itself, forming GAM337226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337226 precursor RNA, designated SEQ ID NO: 6868, and a schematic representation of a predicted secondary folding of GAM337226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337226 folded precursor RNA yielding a GAM337226 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337226 RNA, hereby incorporated herein.

GAM337226 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337226 target RNA, herein designated GAM TARGET RNA.

GAM337226 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337226 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337226 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337226 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337226 RNA, herein designated GAM RNA, to target binding sites on GAM337226 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337226 target RNA into GAM337226 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337226 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337226 target genes. The mRNA of each one of this plurality of GAM337226 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337226 RNA, herein designated GAM RNA, and which when bound by GAM337226 RNA causes inhibition of translation of the GAM337226 target mRNA into a corresponding GAM337226 target protein.

The mechanism of the translational inhibition exerted by GAM337226 RNA, herein designated GAM RNA, on one or more GAM337226 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337226 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337226 RNA, herein designated GAM RNA, of GAM337226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337226 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337226 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337226 RNA correlate with, and may be deduced from, the identity of the GAM337226 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAGTGACCCA GAM337227 is a novel bioinformatically detectable regulatory, non protein
TATTCATGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337227 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGTGAG encoded by the human genome.

ACCCTCTCTC GAM337227 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM337227 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337227 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337227 precursor RNA is designated SEQ ID:7122, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7122 is located from position 88903075 to position 88903175 relative to chromosome 10 on the `+` strand.

GAM337227 precursor RNA folds onto itself, forming GAM337227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337227 precursor RNA, designated SEQ ID NO: 7122, and a schematic representation of a predicted secondary folding of GAM337227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337227 folded precursor RNA yielding a GAM337227 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337227 RNA, hereby incorporated herein. Expression of GAM337227 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337227 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337227 target RNA, herein designated GAM TARGET RNA.

GAM337227 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337227 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337227 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337227 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337227 RNA, herein designated GAM RNA, to target binding sites on GAM337227 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337227 target RNA into GAM337227 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337227 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337227 target genes. The mRNA of each one of this plurality of GAM337227 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337227 RNA, herein designated GAM RNA, and which when bound by GAM337227 RNA causes inhibition of translation of the GAM337227 target mRNA into a corresponding GAM337227 target protein.

The mechanism of the translational inhibition exerted by GAM337227 RNA, herein designated GAM RNA, on one or more GAM337227 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337227 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337227 RNA, herein designated GAM RNA, of GAM337227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337227 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337227 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337227 RNA correlate with, and may be deduced from, the identity of the GAM337227 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337228 5902 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337228 (GAM337228) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337228 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337228 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337228 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337228 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337228 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337228 precursor RNA is designated SEQ ID:5902, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5902 is located from position 88997770 to position 88997851 relative to chromosome 3 on the `+` strand.

GAM337228 precursor RNA folds onto itself, forming GAM337228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337228 precursor RNA, designated SEQ ID NO: 5902, and a schematic representation of a predicted secondary folding of GAM337228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337228 folded precursor RNA yielding a GAM337228 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337228 RNA, hereby incorporated herein.

GAM337228 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337228 target RNA, herein designated GAM TARGET RNA.

GAM337228 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337228 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337228 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337228 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337228 RNA, herein designated GAM RNA, to target binding sites on GAM337228 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337228 target RNA into GAM337228 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337228 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337228 target genes. The mRNA of each one of this plurality of GAM337228 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337228 RNA, herein designated GAM RNA, and which when bound by GAM337228 RNA causes inhibition of translation of the GAM337228 target mRNA into a corresponding GAM337228 target protein.

The mechanism of the translational inhibition exerted by GAM337228 RNA, herein designated GAM RNA, on one or more GAM337228 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337228 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337228 RNA, herein designated GAM RNA, of GAM337228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337228 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337228 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337228 RNA correlate with, and may be deduced from, the identity of the GAM337228 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337229 7211 TGCTTCTAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
AACCTCCATC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCATGCCATG Messenger 337229 (GAM337229) oligonucleotides modulates expression of respective target
GTGCTTCGAG genes whose function and utility is known in the art.

GAGCGTACCA GAM337229 is a novel bioinformatically detectable regulatory, non protein
GCCTTGCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337229 was detected
ACCACAACAG is described with additional reference to Figs. 9-15.

GGACTGGGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGAGGCA encoded by the human genome.

GAM337229 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337229 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337229 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337229 precursor RNA is designated SEQ ID:7211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7211 is located from position 89060884 to position 89060970 relative to chromosome 16 on the `+` strand.

GAM337229 precursor RNA folds onto itself, forming GAM337229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337229 precursor RNA, designated SEQ ID NO: 7211, and a schematic representation of a predicted secondary folding of GAM337229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337229 folded precursor RNA yielding a GAM337229 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337229 RNA, hereby incorporated herein.

GAM337229 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337229 target RNA, herein designated GAM TARGET RNA.

GAM337229 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337229 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337229 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337229 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337229 RNA, herein designated GAM RNA, to target binding sites on GAM337229 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337229 target RNA into GAM337229 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337229 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337229 target genes. The mRNA of each one of this plurality of GAM337229 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM337229 RNA, herein designated GAM RNA, and which when bound by GAM337229 RNA causes inhibition of translation of the GAM337229 target mRNA into a corresponding GAM337229 target protein.

The mechanism of the translational inhibition exerted by GAM337229 RNA, herein designated GAM RNA, on one or more GAM337229 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337229 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337229 RNA, herein designated GAM RNA, of GAM337229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337229 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337229 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337229 RNA correlate with, and may be deduced from, the identity of the GAM337229 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337230 6118 CCTGCCCACC Fig. 8 further provides a conceptual description of another novel bioinformatically
AACTCCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CTTATTCACC Messenger 337230 (GAM337230) oligonucleotides modulates expression of respective target
AACCACTCCA genes whose function and utility is known in the art.

CCAGCTCTGA GAM337230 is a novel bioinformatically detectable regulatory, non protein
CCCTGACTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337230 was detected
TGGGGTTCCC is described with additional reference to Figs. 9-15.

ATCTCAGTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCAGCCTGTG encoded by the human genome.

CTGCTGCCCC GAM337230 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTGAAGAGCA GAM337230 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

TCCTTCCAGG GAM337230 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337230 precursor RNA is designated SEQ ID:6118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6118 is located from position 89181165 to position 89181284 relative to chromosome 9 on the `-` strand.

GAM337230 precursor RNA folds onto itself, forming GAM337230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337230 precursor RNA, designated SEQ ID NO: 6118, and a schematic representation of a predicted secondary folding of GAM337230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337230 folded precursor RNA yielding a GAM337230 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337230 RNA, hereby incorporated herein.

GAM337230 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337230 target RNA, herein designated GAM TARGET RNA.

GAM337230 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337230 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337230 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337230 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337230 RNA, herein designated GAM RNA, to target

binding sites on GAM337230 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337230 target RNA into GAM337230 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337230 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337230 target genes. The mRNA of each one of this plurality of GAM337230 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337230 RNA, herein designated GAM RNA, and which when bound by GAM337230 RNA causes inhibition of translation of the GAM337230 target mRNA into a corresponding GAM337230 target protein.

The mechanism of the translational inhibition exerted by GAM337230 RNA, herein designated GAM RNA, on one or more GAM337230 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337230 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337230 RNA, herein designated GAM RNA, of GAM337230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337230 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337230 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337230 RNA correlate with, and may be deduced from, the identity of the GAM337230 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337232 6207 CTGAGTTTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATAGGGAACT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTGGGTTTA Messenger 337232 (GAM337232) oligonucleotides modulates expression of respective target

AAGTCACCGT genes whose function and utility is known in the art.

TGGAACTACA GAM337232 is a novel bioinformatically detectable regulatory, non protein

CTGTGTGATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337232 was detected

TTATAAACTT is described with additional reference to Figs. 9-15.

ATGTTCCCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTATCATAT encoded by the human genome.

TCTTGGCTCA GAM337232 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

G GAM337232 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337232 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337232 precursor RNA is designated SEQ ID:6207, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6207 is located from position 89243160 to position 89243260 relative to chromosome 11 on the `-` strand.

GAM337232 precursor RNA folds onto itself, forming GAM337232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337232 precursor RNA, designated SEQ ID NO: 6207, and a schematic representation of a predicted secondary folding of GAM337232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337232 folded precursor RNA yielding a GAM337232 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337232 RNA, hereby incorporated herein.

GAM337232 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337232 target RNA, herein designated GAM TARGET RNA.

GAM337232 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337232 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337232 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337232 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337232 RNA, herein designated GAM RNA, to target binding sites on GAM337232 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337232 target RNA into GAM337232 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337232 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337232 target genes. The mRNA of each one of this plurality of GAM337232 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337232 RNA, herein designated GAM RNA, and which when bound by GAM337232 RNA causes inhibition of translation of the GAM337232 target mRNA into a corresponding GAM337232 target protein.

The mechanism of the translational inhibition exerted by GAM337232 RNA, herein designated GAM RNA, on one or more GAM337232 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337232 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337232 RNA, herein designated GAM RNA, of GAM337232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337232 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337232 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337232 RNA correlate with, and may be deduced from, the identity of the GAM337232 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTCGAGGCTG Messenger 337233 (GAM337233) oligonucleotides modulates expression of respective target
CAGTGAGCTG genes whose function and utility is known in the art.

TGATCACACC GAM337233 is a novel bioinformatically detectable regulatory, non protein
ACTGCACTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337233 was detected
AGCCTGGGCA is described with additional reference to Figs. 9-15.

ACAGAGCGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACC encoded by the human genome.

GAM337233 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337233 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337233 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337233 precursor RNA is designated SEQ ID:6719, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6719 is located from position 89325453 to position 89325535 relative to chromosome 14 on the `-` strand.

GAM337233 precursor RNA folds onto itself, forming GAM337233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337233 precursor RNA, designated SEQ ID NO: 6719, and a schematic representation of a predicted secondary folding of GAM337233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337233 folded precursor RNA yielding a GAM337233 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337233 RNA, hereby incorporated herein. Expression of GAM337233 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337233 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337233 target RNA, herein designated GAM TARGET RNA.

GAM337233 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337233 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337233 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337233 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337233 RNA, herein designated GAM RNA, to target binding sites on GAM337233 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337233 target RNA into GAM337233 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337233 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337233 target genes. The mRNA of each one of this plurality of GAM337233 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337233 RNA, herein designated GAM RNA, and which when bound by GAM337233 RNA causes inhibition of translation of the GAM337233 target mRNA into a corresponding GAM337233 target protein.

The mechanism of the translational inhibition exerted by GAM337233 RNA, herein designated GAM RNA, on one or more GAM337233 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337233 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337233 RNA, herein designated GAM RNA, of GAM337233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337233 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337233 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337233 RNA correlate with, and may be deduced from, the identity of the GAM337233 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCACACCACT GAM337234 is a novel bioinformatically detectable regulatory, non protein
GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337234 was detected
CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337234 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337234 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337234 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337234 precursor RNA is designated SEQ ID:7060, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7060 is located from position 89325457 to position 89325532 relative to chromosome 14 on the `-` strand.

GAM337234 precursor RNA folds onto itself, forming GAM337234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337234 precursor RNA, designated SEQ ID NO: 7060, and a schematic representation of a predicted secondary folding of GAM337234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337234 folded precursor RNA yielding a GAM337234 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337234 RNA, hereby incorporated herein. Expression of GAM337234 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337234 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337234 target RNA, herein designated GAM TARGET RNA.

GAM337234 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337234 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337234 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337234 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337234 RNA, herein designated GAM RNA, to target binding sites on GAM337234 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337234 target RNA into GAM337234 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337234 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337234 target genes. The mRNA of each one of this plurality of GAM337234 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337234 RNA, herein designated GAM RNA, and which when bound by GAM337234 RNA causes inhibition of translation of the GAM337234 target mRNA into a corresponding GAM337234 target protein.

The mechanism of the translational inhibition exerted by GAM337234 RNA, herein designated GAM RNA, on one or more GAM337234 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337234 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337234 RNA, herein designated GAM RNA, of

GAM337234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337234 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337234 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337234 RNA correlate with, and may be deduced from, the identity of the GAM337234 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337235 6142 CGCTTGAGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGGAGTTCG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCTGCAGT Messenger 337235 (GAM337235) oligonucleotides modulates expression of respective target

GAGCTGTGAT genes whose function and utility is known in the art.

CACACCACTG GAM337235 is a novel bioinformatically detectable regulatory, non protein

CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337235 was detected

TGGGCAACAG is described with additional reference to Figs. 9-15.

AGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337235 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337235 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337235 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337235 precursor RNA is designated SEQ ID:6142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6142 is located from position 89325458 to position 89325531 relative to chromosome 14 on the `-` strand.

GAM337235 precursor RNA folds onto itself, forming GAM337235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337235 precursor RNA, designated SEQ ID NO: 6142, and

a schematic representation of a predicted secondary folding of GAM337235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337235 folded precursor RNA yielding a GAM337235 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337235 RNA, hereby incorporated herein. Expression of GAM337235 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337235 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337235 target RNA, herein designated GAM TARGET RNA.

GAM337235 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337235 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337235 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337235 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337235 RNA, herein designated GAM RNA, to target binding sites on GAM337235 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337235 target RNA into GAM337235 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337235 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337235 target genes. The mRNA of each one of this plurality of GAM337235 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337235 RNA, herein designated GAM RNA, and which when bound by GAM337235 RNA causes inhibition of translation of the GAM337235 target mRNA into a corresponding GAM337235 target protein.

The mechanism of the translational inhibition exerted by GAM337235 RNA, herein designated GAM RNA, on one or more GAM337235 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337235 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337235 RNA, herein designated GAM RNA, of GAM337235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337235 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337235 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337235 RNA correlate with, and may be deduced from, the identity of the GAM337235 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337237 6415 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAGGAAG Messenger 337237 (GAM337237) oligonucleotides modulates expression of respective target

CAGAGGTTGC genes whose function and utility is known in the art.

GGTGAGCTGA GAM337237 is a novel bioinformatically detectable regulatory, non protein

ATCATGCCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337237 was detected

TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGCAGCAC encoded by the human genome.

TTCGTCTC GAM337237 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337237 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337237 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337237 precursor RNA is designated SEQ ID:6415, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6415 is located from position 89368234 to position 89368331 relative to chromosome 4 on the `+` strand.

GAM337237 precursor RNA folds onto itself, forming GAM337237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337237 precursor RNA, designated SEQ ID NO: 6415, and a schematic representation of a predicted secondary folding of GAM337237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337237 folded precursor RNA yielding a GAM337237 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337237 RNA, hereby incorporated herein. Expression of GAM337237 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337237 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337237 target RNA, herein designated GAM TARGET RNA.

GAM337237 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337237 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337237 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337237 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337237 RNA, herein designated GAM RNA, to target binding sites on GAM337237 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337237 target RNA into GAM337237 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337237 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337237 target genes. The mRNA of each one of this plurality of GAM337237 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337237 RNA, herein designated GAM RNA, and which when bound by GAM337237 RNA causes inhibition of translation of the GAM337237 target mRNA into a corresponding GAM337237 target protein.

The mechanism of the translational inhibition exerted by GAM337237 RNA, herein designated GAM RNA, on one or more GAM337237 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337237 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337237 RNA, herein designated GAM RNA, of GAM337237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337237 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337237 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337237 RNA correlate with, and may be deduced from, the identity of the GAM337237 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337238 6681 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAGCAGAGG Messenger 337238 (GAM337238) oligonucleotides modulates expression of respective target
TTGCGGTGAG genes whose function and utility is known in the art.

CTGAATCATG GAM337238 is a novel bioinformatically detectable regulatory, non protein
CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337238 was detected
CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCACTTC encoded by the human genome.

GAM337238 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337238 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337238 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337238 precursor RNA is designated SEQ ID:6681, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6681 is located from position 89368240 to position 89368326 relative to chromosome 4 on the `+` strand.

GAM337238 precursor RNA folds onto itself, forming GAM337238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337238 precursor RNA, designated SEQ ID NO: 6681, and a schematic representation of a predicted secondary folding of GAM337238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337238 folded precursor RNA yielding a GAM337238 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337238 RNA, hereby incorporated herein. Expression of GAM337238 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337238 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337238 target RNA, herein designated GAM TARGET RNA.

GAM337238 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337238 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337238 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337238 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337238 RNA, herein designated GAM RNA, to target binding sites on GAM337238 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337238 target RNA into GAM337238 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337238 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337238 target genes. The mRNA of each one of this plurality of GAM337238 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337238 RNA, herein designated GAM RNA, and which when bound by GAM337238 RNA causes inhibition of translation of the GAM337238 target mRNA into a corresponding GAM337238 target protein.

The mechanism of the translational inhibition exerted by GAM337238 RNA, herein designated GAM RNA, on one or more GAM337238 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337238 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337238 RNA, herein designated GAM RNA, of GAM337238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337238 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337238 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337238 RNA correlate with, and may be deduced from, the identity of the GAM337238 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337242 7196 TGCATGCTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTAAATCATT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGTCTCATT Messenger 337242 (GAM337242) oligonucleotides modulates expression of respective target

TGTCTGTTGG genes whose function and utility is known in the art.

AAATACAGTT GAM337242 is a novel bioinformatically detectable regulatory, non protein
CTGGCACTAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337242 was detected
GATATGGTGA is described with additional reference to Figs. 9-15.

ACAGACAGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGAGGCCACA encoded by the human genome.

ACATTCA GAM337242 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337242 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337242 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337242 precursor RNA is designated SEQ ID:7196, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7196 is located from position 89742768 to position 89742864 relative to chromosome 7 on the `+` strand.

GAM337242 precursor RNA folds onto itself, forming GAM337242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337242 precursor RNA, designated SEQ ID NO: 7196, and a schematic representation of a predicted secondary folding of GAM337242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337242 folded precursor RNA yielding a GAM337242 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337242 RNA, hereby incorporated herein.

GAM337242 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337242 target RNA, herein designated GAM TARGET RNA.

GAM337242 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337242 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337242 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337242 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337242 RNA, herein designated GAM RNA, to target binding sites on GAM337242 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337242 target RNA into GAM337242 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337242 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337242 target genes. The mRNA of each one of this plurality of GAM337242 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337242 RNA, herein designated GAM RNA, and which when bound by GAM337242 RNA causes inhibition of translation of the GAM337242 target mRNA into a corresponding GAM337242 target protein.

The mechanism of the translational inhibition exerted by GAM337242 RNA, herein designated GAM RNA, on one or more GAM337242 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337242 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337242 RNA, herein designated GAM RNA, of GAM337242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337242 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337242 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337242 RNA correlate with, and may be deduced from, the identity of the GAM337242 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337243 6940 GTTCTCTATG Fig. 8 further provides a conceptual description of another novel bioinformatically
GCTAGGCAGT detected oligonucleotides of the present invention, referred to here as Genomic Address
AAAGAAACAG Messenger 337243 (GAM337243) oligonucleotides modulates expression of respective target
CACCCTTCAT genes whose function and utility is known in the art.

ATTTTAAGGG GAM337243 is a novel bioinformatically detectable regulatory, non protein
ACTGTGCTAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337243 was detected
ATTTCTTCAT is described with additional reference to Figs. 9-15.

TCTTGGCGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTGAGAAT encoded by the human genome.

GAM337243 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337243 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337243 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337243 precursor RNA is designated SEQ ID:6940, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6940 is located from position 89931751 to position 89931839 relative to chromosome 14 on the `+` strand.

GAM337243 precursor RNA folds onto itself, forming GAM337243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337243 precursor RNA, designated SEQ ID NO: 6940, and a schematic representation of a predicted secondary folding of GAM337243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337243 folded precursor RNA yielding a GAM337243 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337243 RNA, hereby incorporated herein.

GAM337243 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337243 target RNA, herein designated GAM TARGET RNA.

GAM337243 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337243 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337243 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337243 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337243 RNA, herein designated GAM RNA, to target binding sites on GAM337243 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337243 target RNA into GAM337243 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337243 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337243 target genes. The mRNA of each one of this plurality of GAM337243 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337243 RNA, herein designated GAM RNA, and which when bound by GAM337243 RNA causes inhibition of translation of the GAM337243 target mRNA into a corresponding GAM337243 target protein.

The mechanism of the translational inhibition exerted by GAM337243 RNA, herein designated GAM RNA, on one or more GAM337243 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337243 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337243 RNA, herein designated GAM RNA, of GAM337243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337243 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337243 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337243 RNA correlate with, and may be deduced from, the identity of the GAM337243 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337245 6950 GTTTTTACTA Fig. 8 further provides a conceptual description of another novel bioinformatically
TAACATATTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TAGAAAGCTA Messenger 337245 (GAM337245) oligonucleotides modulates expression of respective target
ACAAGCTAGA genes whose function and utility is known in the art.

GAGAGCGGTG GAM337245 is a novel bioinformatically detectable regulatory, non protein
AAGGGCTCTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337245 was detected
TCAGCATGTT is described with additional reference to Figs. 9-15.

CCTCTCTGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGTGTGTTAG encoded by the human genome.

TTTTGC GAM337245 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337245 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337245 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337245 precursor RNA is designated SEQ ID:6950, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6950 is located from position 90083877 to position 90083972 relative to chromosome 11 on the `+` strand.

GAM337245 precursor RNA folds onto itself, forming GAM337245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337245 precursor RNA, designated SEQ ID NO: 6950, and a schematic representation of a predicted secondary folding of GAM337245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337245 folded precursor RNA yielding a GAM337245 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337245 RNA, hereby incorporated herein.

GAM337245 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337245 target RNA, herein designated GAM TARGET RNA.

GAM337245 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337245 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337245 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337245 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337245 RNA, herein designated GAM RNA, to target binding sites on GAM337245 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337245 target RNA into GAM337245 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337245 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337245 target genes. The mRNA of each one of this plurality of GAM337245 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337245 RNA, herein designated GAM RNA, and which when bound by GAM337245 RNA causes inhibition of translation of the GAM337245 target mRNA into a corresponding GAM337245 target protein.

The mechanism of the translational inhibition exerted by GAM337245 RNA, herein designated GAM RNA, on one or more GAM337245 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337245 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337245 RNA, herein designated GAM RNA, of

GAM337245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337245 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337245 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337245 RNA correlate with, and may be deduced from, the identity of the GAM337245 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337246 6955 TAACATATTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TAGAAAGCTA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACAAGCTAGA Messenger 337246 (GAM337246) oligonucleotides modulates expression of respective target

GAGAGCGGTG genes whose function and utility is known in the art.

AAGGGCTCTC GAM337246 is a novel bioinformatically detectable regulatory, non protein

TCAGCATGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337246 was detected

CCTCTCTGTC is described with additional reference to Figs. 9-15.

TGTGTGTTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337246 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337246 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337246 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337246 precursor RNA is designated SEQ ID:6955, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6955 is located from position 90083887 to position 90083965 relative to chromosome 11 on the `+` strand.

GAM337246 precursor RNA folds onto itself, forming GAM337246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337246 precursor RNA, designated SEQ ID NO: 6955, and

a schematic representation of a predicted secondary folding of GAM337246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337246 folded precursor RNA yielding a GAM337246 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337246 RNA, hereby incorporated herein.

GAM337246 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337246 target RNA, herein designated GAM TARGET RNA.

GAM337246 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337246 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337246 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337246 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337246 RNA, herein designated GAM RNA, to target binding sites on GAM337246 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337246 target RNA into GAM337246 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337246 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337246 target genes. The mRNA of each one of this plurality of GAM337246 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337246 RNA, herein designated GAM RNA, and which when bound by GAM337246 RNA causes inhibition of translation of the GAM337246 target mRNA into a corresponding GAM337246 target protein.

The mechanism of the translational inhibition exerted by GAM337246 RNA, herein designated GAM RNA, on one or more GAM337246 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337246 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337246 RNA, herein designated GAM RNA, of GAM337246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337246 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337246 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337246 RNA correlate with, and may be deduced from, the identity of the GAM337246 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337247 6879 GTCCCCTTTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTTTCTACC detected oligonucleotides of the present invention, referred to here as Genomic Address

ATACCCCCAG Messenger 337247 (GAM337247) oligonucleotides modulates expression of respective target

TAAAGCTACT genes whose function and utility is known in the art.

TAAAATCCTC GAM337247 is a novel bioinformatically detectable regulatory, non protein

TGTAGGAAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337247 was detected

AGCTGAGTAA is described with additional reference to Figs. 9-15.

TTGGGGGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGATGGAGGA encoded by the human genome.

C GAM337247 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337247 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337247 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337247 precursor RNA is designated SEQ ID:6879, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6879 is located from position 90114587 to position 90114677 relative to chromosome 11 on the `-` strand.

GAM337247 precursor RNA folds onto itself, forming GAM337247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337247 precursor RNA, designated SEQ ID NO: 6879, and a schematic representation of a predicted secondary folding of GAM337247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337247 folded precursor RNA yielding a GAM337247 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337247 RNA, hereby incorporated herein.

GAM337247 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337247 target RNA, herein designated GAM TARGET RNA.

GAM337247 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337247 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337247 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337247 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337247 RNA, herein designated GAM RNA, to target binding sites on GAM337247 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337247 target RNA into GAM337247 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337247 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337247 target genes. The mRNA of each one of this plurality of GAM337247 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337247 RNA, herein designated GAM RNA, and which when bound by GAM337247 RNA causes inhibition of translation of the GAM337247 target mRNA into a corresponding GAM337247 target protein.

The mechanism of the translational inhibition exerted by GAM337247 RNA, herein designated GAM RNA, on one or more GAM337247 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337247 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337247 RNA, herein designated GAM RNA, of GAM337247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337247 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337247 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337247 RNA correlate with, and may be deduced from, the identity of the GAM337247 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337248 5903 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337248 (GAM337248) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337248 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337248 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337248 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337248 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337248 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337248 precursor RNA is designated SEQ

ID:5903, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5903 is located from position 90495199 to position 90495280 relative to chromosome 11 on the `+` strand.

GAM337248 precursor RNA folds onto itself, forming GAM337248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337248 precursor RNA, designated SEQ ID NO: 5903, and a schematic representation of a predicted secondary folding of GAM337248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337248 folded precursor RNA yielding a GAM337248 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337248 RNA, hereby incorporated herein.

GAM337248 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337248 target RNA, herein designated GAM TARGET RNA.

GAM337248 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337248 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337248 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337248 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337248 RNA, herein designated GAM RNA, to target binding sites on GAM337248 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337248 target RNA into GAM337248 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337248 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337248 target genes. The mRNA of each one of this plurality of GAM337248 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337248 RNA, herein designated GAM RNA, and which when bound by GAM337248 RNA causes inhibition of translation of the GAM337248 target mRNA into a corresponding GAM337248 target protein.

The mechanism of the translational inhibition exerted by GAM337248 RNA, herein designated GAM RNA, on one or more GAM337248 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337248 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337248 RNA, herein designated GAM RNA, of GAM337248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337248 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337248 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337248 RNA correlate with, and may be deduced from, the identity of the GAM337248 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337250 5904 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337250 (GAM337250) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337250 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337250 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337250 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337250 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337250 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337250 precursor RNA is designated SEQ ID:5904, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5904 is located from position 91509421 to position 91509502 relative to chromosome 14 on the `-` strand.

GAM337250 precursor RNA folds onto itself, forming GAM337250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337250 precursor RNA, designated SEQ ID NO: 5904, and a schematic representation of a predicted secondary folding of GAM337250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337250 folded precursor RNA yielding a GAM337250 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337250 RNA, hereby incorporated herein.

GAM337250 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337250 target RNA, herein designated GAM TARGET RNA.

GAM337250 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337250 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337250 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337250 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337250 RNA, herein designated GAM RNA, to target binding sites on GAM337250 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337250 target RNA into GAM337250 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337250 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337250 target genes. The mRNA of each one of this plurality of GAM337250 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337250 RNA, herein designated GAM RNA, and which when bound by GAM337250 RNA causes inhibition of translation of the GAM337250 target mRNA into a corresponding GAM337250 target protein.

The mechanism of the translational inhibition exerted by GAM337250 RNA, herein designated GAM RNA, on one or more GAM337250 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337250 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337250 RNA, herein designated GAM RNA, of GAM337250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337250 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337250 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337250 RNA correlate with, and may be deduced from, the identity of the GAM337250 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337251 6837 GGTCGAGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTGTATCGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGAGCCCAG Messenger 337251 (GAM337251) oligonucleotides modulates expression of respective target

GAGTTTGAGT genes whose function and utility is known in the art.

CCAGCCTGGG GAM337251 is a novel bioinformatically detectable regulatory, non protein
CAACATAGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337251 was detected
AGACCTTGTC is described with additional reference to Figs. 9-15.

TTGACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337251 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337251 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337251 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337251 precursor RNA is designated SEQ ID:6837, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6837 is located from position 91699065 to position 91699140 relative to chromosome 10 on the `+` strand.

GAM337251 precursor RNA folds onto itself, forming GAM337251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337251 precursor RNA, designated SEQ ID NO: 6837, and a schematic representation of a predicted secondary folding of GAM337251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337251 folded precursor RNA yielding a GAM337251 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337251 RNA, hereby incorporated herein.

GAM337251 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337251 target RNA, herein designated GAM TARGET RNA.

GAM337251 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337251 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337251 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337251 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337251 RNA, herein designated GAM RNA, to target binding sites on GAM337251 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337251 target RNA into GAM337251 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337251 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337251 target genes. The mRNA of each one of this plurality of GAM337251 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337251 RNA, herein designated GAM RNA, and which when bound by GAM337251 RNA causes inhibition of translation of the GAM337251 target mRNA into a corresponding GAM337251 target protein.

The mechanism of the translational inhibition exerted by GAM337251 RNA, herein designated GAM RNA, on one or more GAM337251 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337251 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337251 RNA, herein designated GAM RNA, of GAM337251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337251 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337251 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337251 RNA correlate with, and may be deduced from, the identity of the GAM337251 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337254 5757 AGGAATTTGT Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGAAACTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
TTCCTGTTTT Messenger 337254 (GAM337254) oligonucleotides modulates expression of respective target
GGTTTGGAGA genes whose function and utility is known in the art.

GTAGTTCTCT GAM337254 is a novel bioinformatically detectable regulatory, non protein
CTAACTAGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337254 was detected
ACAGGAGTGG is described with additional reference to Figs. 9-15.

CCTTGAAATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTCCT encoded by the human genome.

GAM337254 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337254 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337254 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337254 precursor RNA is designated SEQ ID:5757, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5757 is located from position 91841622 to position 91841706 relative to chromosome 7 on the `-` strand.

GAM337254 precursor RNA folds onto itself, forming GAM337254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337254 precursor RNA, designated SEQ ID NO: 5757, and a schematic representation of a predicted secondary folding of GAM337254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337254 folded precursor RNA yielding a GAM337254 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337254 RNA, hereby incorporated herein.

GAM337254 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337254 target RNA, herein designated GAM TARGET RNA.

GAM337254 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337254 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337254 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337254 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337254 RNA, herein designated GAM RNA, to target binding sites on GAM337254 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337254 target RNA into GAM337254 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337254 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337254 target genes. The mRNA of each one of this plurality of GAM337254 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337254 RNA, herein designated GAM RNA, and which when bound by GAM337254 RNA causes inhibition of translation of the GAM337254 target mRNA into a corresponding GAM337254 target protein.

The mechanism of the translational inhibition exerted by GAM337254 RNA, herein designated GAM RNA, on one or more GAM337254 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337254 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337254 RNA, herein designated GAM RNA, of GAM337254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337254 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337254 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337254 RNA correlate with, and may be deduced from, the identity of the GAM337254 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337255 6961 TACCTTCTTT Fig. 8 further provides a conceptual description of another novel bioinformatically
GCTGCCTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGATGCTGCT Messenger 337255 (GAM337255) oligonucleotides modulates expression of respective target
ATGGGCGTTT genes whose function and utility is known in the art.

ATTTGATCTG GAM337255 is a novel bioinformatically detectable regulatory, non protein
CTTGTGGCTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337255 was detected
AGTTTGCTCA is described with additional reference to Figs. 9-15.

GCAGTGAAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAAGGTG encoded by the human genome.

GAM337255 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337255 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337255 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337255 precursor RNA is designated SEQ ID:6961, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6961 is located from position 92455725 to position 92455811 relative to chromosome 14 on the `+` strand.

GAM337255 precursor RNA folds onto itself, forming GAM337255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337255 precursor RNA, designated SEQ ID NO: 6961, and a schematic representation of a predicted secondary folding of GAM337255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337255 folded precursor RNA yielding a GAM337255 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337255 RNA, hereby incorporated herein.

GAM337255 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337255 target RNA, herein designated GAM TARGET RNA.

GAM337255 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337255 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337255 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337255 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337255 RNA, herein designated GAM RNA, to target binding sites on GAM337255 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337255 target RNA into GAM337255 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337255 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337255 target genes. The mRNA of each one of this plurality of GAM337255 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337255 RNA, herein designated GAM RNA, and which when bound by GAM337255 RNA causes inhibition of translation of the GAM337255 target mRNA into a corresponding GAM337255 target protein.

The mechanism of the translational inhibition exerted by GAM337255 RNA, herein designated GAM RNA, on one or more GAM337255 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337255 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337255 RNA, herein designated GAM RNA, of GAM337255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337255 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337255 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337255 RNA correlate with, and may be deduced from, the identity of the GAM337255 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337256 5700 ACCTTCTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically
CTGCCTGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GATGCTGCTA Messenger 337256 (GAM337256) oligonucleotides modulates expression of respective target
TGGGCGTTTA genes whose function and utility is known in the art.

TTTGATCTGC GAM337256 is a novel bioinformatically detectable regulatory, non protein
TTGTGGCTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337256 was detected
GTTTGCTCAG is described with additional reference to Figs. 9-15.

CAGTGAAATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGGT encoded by the human genome.

GAM337256 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337256 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337256 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337256 precursor RNA is designated SEQ ID:5700, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5700 is located from position 92455726 to position 92455810 relative to chromosome 14 on the `+` strand.

GAM337256 precursor RNA folds onto itself, forming GAM337256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337256 precursor RNA, designated SEQ ID NO: 5700, and a schematic representation of a predicted secondary folding of GAM337256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337256 folded precursor RNA yielding a GAM337256 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337256 RNA, hereby incorporated herein.

GAM337256 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337256 target RNA, herein designated GAM TARGET RNA.

GAM337256 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337256 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337256 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337256 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337256 RNA, herein designated GAM RNA, to target binding sites on GAM337256 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337256 target RNA into GAM337256 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337256 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337256 target genes. The mRNA of each one of this plurality of GAM337256 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337256 RNA, herein designated GAM RNA, and which when bound by GAM337256 RNA causes inhibition of translation of the GAM337256 target mRNA into a corresponding GAM337256 target protein.

The mechanism of the translational inhibition exerted by GAM337256 RNA, herein designated GAM RNA, on one or more GAM337256 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337256 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337256 RNA, herein designated GAM RNA, of GAM337256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337256 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337256 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337256 RNA correlate with, and may be deduced from, the identity of the GAM337256 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337257 6251 CTTACCCTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGGGGTTGC GAM337257 is a novel bioinformatically detectable regulatory, non protein

CGTGTCTCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337257 was detected

AGCAATTAAG is described with additional reference to Figs. 9-15.

GAGATGGCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGCCAAGCA encoded by the human genome.

GTGTGAAGTG GAM337257 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

ACAGCACCAG GAM337257 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337257 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337257 precursor RNA is designated SEQ ID:6251, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6251 is located from position 92938874 to position 92938983 relative to chromosome 10 on the `+` strand.

GAM337257 precursor RNA folds onto itself, forming GAM337257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337257 precursor RNA, designated SEQ ID NO: 6251, and a schematic representation of a predicted secondary folding of GAM337257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337257 folded precursor RNA yielding a GAM337257 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337257 RNA, hereby incorporated herein.

GAM337257 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337257 target RNA, herein designated GAM TARGET RNA.

GAM337257 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337257 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337257 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337257 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337257 RNA, herein designated GAM RNA, to target binding sites on GAM337257 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337257 target RNA into GAM337257 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337257 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337257 target genes. The mRNA of each one of this plurality of GAM337257 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337257 RNA, herein designated GAM RNA, and which when bound by GAM337257 RNA causes inhibition of translation of the GAM337257 target mRNA into a corresponding GAM337257 target protein.

The mechanism of the translational inhibition exerted by GAM337257 RNA, herein designated GAM RNA, on one or more GAM337257 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337257 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337257 RNA, herein designated GAM RNA, of GAM337257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337257 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337257 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337257 RNA correlate with, and may be deduced from, the identity of the GAM337257 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337258 6238 CTGTATTTCA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCAATACAA detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGAAGATGG Messenger 337258 (GAM337258) oligonucleotides modulates expression of respective target

CTGTTTGGGG genes whose function and utility is known in the art.

TTGCCGTGTC GAM337258 is a novel bioinformatically detectable regulatory, non protein

TCTTAGCAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337258 was detected

TAAGGAGATG is described with additional reference to Figs. 9-15.

GCTACAGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGCAGTGTGA encoded by the human genome.

AGTGACAG GAM337258 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337258 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337258 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337258 precursor RNA is designated SEQ ID:6238, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6238 is located from position 92938880 to position 92938977 relative to chromosome 10 on the `+` strand.

GAM337258 precursor RNA folds onto itself, forming GAM337258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337258 precursor RNA, designated SEQ ID NO: 6238, and a schematic representation of a predicted secondary folding of GAM337258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337258 folded precursor RNA yielding a GAM337258 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337258 RNA, hereby incorporated herein.

GAM337258 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337258 target RNA, herein designated GAM TARGET RNA.

GAM337258 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337258 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337258 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337258 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337258 RNA, herein designated GAM RNA, to target binding sites on GAM337258 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337258 target RNA into GAM337258 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM337258 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337258 target genes. The mRNA of each one of this plurality of GAM337258 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337258 RNA, herein designated GAM RNA, and which when bound by GAM337258 RNA causes inhibition of translation of the GAM337258 target mRNA into a corresponding GAM337258 target protein.

The mechanism of the translational inhibition exerted by GAM337258 RNA, herein designated GAM RNA, on one or more GAM337258 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337258 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337258 RNA, herein designated GAM RNA, of GAM337258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337258 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337258 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337258 RNA correlate with, and may be deduced from, the identity of the GAM337258 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337263 5905 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337263 (GAM337263) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337263 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337263 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337263 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337263 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337263 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337263 precursor RNA is designated SEQ ID:5905, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5905 is located from position 93264106 to position 93264187 relative to chromosome 10 on the `-` strand.

GAM337263 precursor RNA folds onto itself, forming GAM337263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337263 precursor RNA, designated SEQ ID NO: 5905, and a schematic representation of a predicted secondary folding of GAM337263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337263 folded precursor RNA yielding a GAM337263 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337263 RNA, hereby incorporated herein.

GAM337263 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337263 target RNA, herein designated GAM TARGET RNA.

GAM337263 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337263 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337263 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337263 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337263 RNA, herein designated GAM RNA, to target binding sites on GAM337263 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337263 target RNA into GAM337263 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337263 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337263 target genes. The mRNA of each one of this plurality of GAM337263 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337263 RNA, herein designated GAM RNA, and which when bound by GAM337263 RNA causes inhibition of translation of the GAM337263 target mRNA into a corresponding GAM337263 target protein.

The mechanism of the translational inhibition exerted by GAM337263 RNA, herein designated GAM RNA, on one or more GAM337263 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337263 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337263 RNA, herein designated GAM RNA, of GAM337263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337263 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337263 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337263 RNA correlate with, and may be deduced from, the identity of the GAM337263 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337264 7199 TGCCTCTCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCACTTCCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTCCTACCT Messenger 337264 (GAM337264) oligonucleotides modulates expression of respective target

GTGATAGACG genes whose function and utility is known in the art.

TCTAAGTGAA GAM337264 is a novel bioinformatically detectable regulatory, non protein
AGTACTAGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337264 was detected
TAGTTGTTTG is described with additional reference to Figs. 9-15.

GGATTGGTAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGACAGAGAA encoded by the human genome.

AACAGCA GAM337264 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337264 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337264 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337264 precursor RNA is designated SEQ ID:7199, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7199 is located from position 93648456 to position 93648552 relative to chromosome 9 on the `+` strand.

GAM337264 precursor RNA folds onto itself, forming GAM337264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337264 precursor RNA, designated SEQ ID NO: 7199, and a schematic representation of a predicted secondary folding of GAM337264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337264 folded precursor RNA yielding a GAM337264 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337264 RNA, hereby incorporated herein.

GAM337264 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337264 target RNA, herein designated GAM TARGET RNA.

GAM337264 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337264 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337264 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337264 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337264 RNA, herein designated GAM RNA, to target binding sites on GAM337264 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337264 target RNA into GAM337264 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337264 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337264 target genes. The mRNA of each one of this plurality of GAM337264 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337264 RNA, herein designated GAM RNA, and which when bound by GAM337264 RNA causes inhibition of translation of the GAM337264 target mRNA into a corresponding GAM337264 target protein.

The mechanism of the translational inhibition exerted by GAM337264 RNA, herein designated GAM RNA, on one or more GAM337264 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337264 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337264 RNA, herein designated GAM RNA, of GAM337264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337264 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337264 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337264 RNA correlate with, and may be deduced from, the identity of the GAM337264 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337265 7068 TCTCTGGCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTACCTGTGA Messenger 337265 (GAM337265) oligonucleotides modulates expression of respective target
TAGACGTCTA genes whose function and utility is known in the art.

AGTGAAAGTA GAM337265 is a novel bioinformatically detectable regulatory, non protein
CTAGCTTAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337265 was detected
TGTTTGGGAT is described with additional reference to Figs. 9-15.

TGGTAGTGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAGA encoded by the human genome.

GAM337265 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337265 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337265 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337265 precursor RNA is designated SEQ ID:7068, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7068 is located from position 93648460 to position 93648544 relative to chromosome 9 on the `+` strand.

GAM337265 precursor RNA folds onto itself, forming GAM337265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337265 precursor RNA, designated SEQ ID NO: 7068, and a schematic representation of a predicted secondary folding of GAM337265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337265 folded precursor RNA yielding a GAM337265 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337265 RNA, hereby incorporated herein.

GAM337265 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337265 target RNA, herein designated GAM TARGET RNA.

GAM337265 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337265 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337265 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337265 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337265 RNA, herein designated GAM RNA, to target binding sites on GAM337265 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337265 target RNA into GAM337265 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337265 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337265 target genes. The mRNA of each one of this plurality of GAM337265 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337265 RNA, herein designated GAM RNA, and which when bound by GAM337265 RNA causes inhibition of translation of the GAM337265 target mRNA into a corresponding GAM337265 target protein.

The mechanism of the translational inhibition exerted by GAM337265 RNA, herein designated GAM RNA, on one or more GAM337265 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337265 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337265 RNA, herein designated GAM RNA, of GAM337265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337265 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337265 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337265 RNA correlate with, and may be deduced from, the identity of the GAM337265 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TAGCTTAGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337266 was detected
GTTTGGGATT is described with additional reference to Figs. 9-15.

GGTAGTGACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAG encoded by the human genome.

GAM337266 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337266 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337266 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337266 precursor RNA is designated SEQ ID:6176, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6176 is located from position 93648461 to position 93648543 relative to chromosome 9 on the `+` strand.

GAM337266 precursor RNA folds onto itself, forming GAM337266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337266 precursor RNA, designated SEQ ID NO: 6176, and a schematic representation of a predicted secondary folding of GAM337266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337266 folded precursor RNA yielding a GAM337266 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337266 RNA, hereby incorporated herein.

GAM337266 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337266 target RNA, herein designated GAM TARGET RNA.

GAM337266 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337266 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337266 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337266 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337266 RNA, herein designated GAM RNA, to target binding sites on GAM337266 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337266 target RNA into GAM337266 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337266 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337266 target genes. The mRNA of each one of this plurality of GAM337266 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337266 RNA, herein designated GAM RNA, and which when bound by GAM337266 RNA causes inhibition of translation of the GAM337266 target mRNA into a corresponding GAM337266 target protein.

The mechanism of the translational inhibition exerted by GAM337266 RNA, herein designated GAM RNA, on one or more GAM337266 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337266 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337266 RNA, herein designated GAM RNA, of GAM337266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337266 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337266 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337266 RNA correlate with, and may be deduced from, the identity of the GAM337266 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337267 6155 CTATGCCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
CATTGGAAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGTAGAGGCC Messenger 337267 (GAM337267) oligonucleotides modulates expression of respective target
CTTACTAGCA genes whose function and utility is known in the art.

CACCTCAAAT GAM337267 is a novel bioinformatically detectable regulatory, non protein
CAAACTGGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337267 was detected
TTGCAGCAGA is described with additional reference to Figs. 9-15.

CCTTTTGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTTTAGAGG encoded by the human genome.

CTGGAAATAG GAM337267 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337267 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337267 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337267 precursor RNA is designated SEQ ID:6155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6155 is located from position 93666704 to position 93666803 relative to chromosome X on the `+` strand.

GAM337267 precursor RNA folds onto itself, forming GAM337267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337267 precursor RNA, designated SEQ ID NO: 6155, and a schematic representation of a predicted secondary folding of GAM337267 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337267 folded precursor RNA yielding a GAM337267 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337267 RNA, hereby incorporated herein.

GAM337267 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337267 target RNA, herein designated GAM TARGET RNA.

GAM337267 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337267 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337267 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337267 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337267 RNA, herein designated GAM RNA, to target binding sites on GAM337267 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337267 target RNA into GAM337267 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337267 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337267 target genes. The mRNA of each one of this plurality of GAM337267 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337267 RNA, herein designated GAM RNA, and which when bound by GAM337267 RNA causes inhibition of translation of the GAM337267 target mRNA into a corresponding GAM337267 target protein.

The mechanism of the translational inhibition exerted by GAM337267 RNA, herein designated GAM RNA, on one or more GAM337267 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337267 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337267 RNA, herein designated GAM RNA, of GAM337267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337267 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337267 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337267 RNA correlate with, and may be deduced from, the identity of the GAM337267 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337269 7072 TCTGATCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAACTGCATT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTTGGTGGT Messenger 337269 (GAM337269) oligonucleotides modulates expression of respective target

CAGGAGGGGT genes whose function and utility is known in the art.

TCTTAGTAAG GAM337269 is a novel bioinformatically detectable regulatory, non protein

CAAACTCAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337269 was detected

TTAATCCCAG is described with additional reference to Figs. 9-15.

AGTCGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337269 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337269 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337269 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337269 precursor RNA is designated SEQ ID:7072, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7072 is located from position 94289451 to position 94289527 relative to chromosome 15 on the `-` strand.

GAM337269 precursor RNA folds onto itself, forming GAM337269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337269 precursor RNA, designated SEQ ID NO: 7072, and a schematic representation of a predicted secondary folding of GAM337269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337269 folded precursor RNA yielding a GAM337269 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337269 RNA, hereby incorporated herein.

GAM337269 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337269 target RNA, herein designated GAM TARGET RNA.

GAM337269 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337269 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337269 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337269 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337269 RNA, herein designated GAM RNA, to target binding sites on GAM337269 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337269 target RNA into GAM337269 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337269 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337269 target genes. The mRNA of each one of this plurality of GAM337269 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337269 RNA, herein designated GAM RNA, and which when bound by GAM337269 RNA causes inhibition of translation of the GAM337269 target mRNA into a corresponding GAM337269 target protein.

The mechanism of the translational inhibition exerted by GAM337269 RNA, herein designated GAM RNA, on one or more GAM337269 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337269 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337269 RNA, herein designated GAM RNA, of GAM337269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337269 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337269 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337269 RNA correlate with, and may be deduced from, the identity of the GAM337269 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337270 6515 GCGATCTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

AACAATTTCC detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGCTGAACA Messenger 337270 (GAM337270) oligonucleotides modulates expression of respective target

GCCTCACCAG genes whose function and utility is known in the art.

CATGCCATGT GAM337270 is a novel bioinformatically detectable regulatory, non protein

ACTACCTCCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337270 was detected

CTTGCTGATG is described with additional reference to Figs. 9-15.

ACTGAAGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTGGACTAA encoded by the human genome.

AGATGAGTTA GAM337270 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAAGAAGC GAM337270 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337270 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337270 precursor RNA is designated SEQ ID:6515, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6515 is located from position 94365822 to position 94365929 relative to chromosome 10 on the `-` strand.

GAM337270 precursor RNA folds onto itself, forming GAM337270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337270 precursor RNA, designated SEQ ID NO: 6515, and a schematic representation of a predicted secondary folding of GAM337270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337270 folded precursor RNA yielding a GAM337270 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337270 RNA, hereby incorporated herein.

GAM337270 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337270 target RNA, herein designated GAM TARGET RNA.

GAM337270 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337270 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337270 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337270 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337270 RNA, herein designated GAM RNA, to target binding sites on GAM337270 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337270 target RNA into GAM337270 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM337270 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337270 target genes. The mRNA of each one of this plurality of GAM337270 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337270 RNA, herein designated GAM RNA, and which when bound by GAM337270 RNA causes inhibition of translation of the GAM337270 target mRNA into a corresponding GAM337270 target protein.

The mechanism of the translational inhibition exerted by GAM337270 RNA, herein designated GAM RNA, on one or more GAM337270 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337270 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337270 RNA, herein designated GAM RNA, of GAM337270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337270 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337270 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337270 RNA correlate with, and may be deduced from, the identity of the GAM337270 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337271 7070 TCTCTTAACA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTTCCGGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAACAGCCT Messenger 337271 (GAM337271) oligonucleotides modulates expression of respective target

CACCAGCATG genes whose function and utility is known in the art.

CCATGTACTA GAM337271 is a novel bioinformatically detectable regulatory, non protein

CCTCCGCTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337271 was detected

CTGATGACTG is described with additional reference to Figs. 9-15.

AAGTGGCCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACTAAAGAT encoded by the human genome.

GAGTTAAAAG GAM337271 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM337271 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337271 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337271 precursor RNA is designated SEQ ID:7070, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7070 is located from position 94365825 to position 94365925 relative to chromosome 10 on the `-` strand.

GAM337271 precursor RNA folds onto itself, forming GAM337271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337271 precursor RNA, designated SEQ ID NO: 7070, and a schematic representation of a predicted secondary folding of GAM337271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337271 folded precursor RNA yielding a GAM337271 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337271 RNA, hereby incorporated herein.

GAM337271 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337271 target RNA, herein designated GAM TARGET RNA.

GAM337271 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337271 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337271 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337271 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337271 RNA, herein designated GAM RNA, to target binding sites on GAM337271 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337271 target RNA into GAM337271 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337271 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337271 target genes. The mRNA of each one of this plurality of GAM337271 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337271 RNA, herein designated GAM RNA, and which when bound by GAM337271 RNA causes inhibition of translation of the GAM337271 target mRNA into a corresponding GAM337271 target protein.

The mechanism of the translational inhibition exerted by GAM337271 RNA, herein designated GAM RNA, on one or more GAM337271 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337271 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337271 RNA, herein designated GAM RNA, of GAM337271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337271 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337271 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337271 RNA correlate with, and may be deduced from, the identity of the GAM337271 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337273 6141 CGCTTGAGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGGAGGCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTTGCAGT Messenger 337273 (GAM337273) oligonucleotides modulates expression of respective target

GAGCCAAGAT genes whose function and utility is known in the art.

GGCACCACTG GAM337273 is a novel bioinformatically detectable regulatory, non protein CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337273 was detected TGGGCAACAG is described with additional reference to Figs. 9-15.

TG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337273 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337273 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337273 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337273 precursor RNA is designated SEQ ID:6141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6141 is located from position 94706874 to position 94706945 relative to chromosome 1 on the `+` strand.

GAM337273 precursor RNA folds onto itself, forming GAM337273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337273 precursor RNA, designated SEQ ID NO: 6141, and a schematic representation of a predicted secondary folding of GAM337273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337273 folded precursor RNA yielding a GAM337273 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337273 RNA, hereby incorporated herein. Expression of GAM337273 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337273 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337273 target RNA, herein designated GAM TARGET RNA.

GAM337273 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337273 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337273 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337273 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337273 RNA, herein designated GAM RNA, to target binding sites on GAM337273 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337273 target RNA into GAM337273 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337273 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337273 target genes. The mRNA of each one of this plurality of GAM337273 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337273 RNA, herein designated GAM RNA, and which when bound by GAM337273 RNA causes inhibition of translation of the GAM337273 target mRNA into a corresponding GAM337273 target protein.

The mechanism of the translational inhibition exerted by GAM337273 RNA, herein designated GAM RNA, on one or more GAM337273 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337273 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337273 RNA, herein designated GAM RNA, of GAM337273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337273 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337273 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337273 RNA correlate with, and may be deduced from, the identity of the GAM337273 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337274 6350 GAGACTCACC Fig. 8 further provides a conceptual description of another novel bioinformatically
CGTTCTACTG detected oligonucleotides of the present invention, referred to here as Genomic Address
GCAACTGGAG Messenger 337274 (GAM337274) oligonucleotides modulates expression of respective target
TTTGTTCAAG genes whose function and utility is known in the art.

AAATACCTGA GAM337274 is a novel bioinformatically detectable regulatory, non protein
GTTGGTTCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337274 was detected
TAACTGTCGA is described with additional reference to Figs. 9-15.

GTTCGATTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCAAGTGGAA encoded by the human genome.

GGGTGGGAGT GAM337274 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CTC GAM337274 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337274 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337274 precursor RNA is designated SEQ ID:6350, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6350 is located from position 94819576 to position 94819678 relative to chromosome 15 on the `-` strand.

GAM337274 precursor RNA folds onto itself, forming GAM337274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337274 precursor RNA, designated SEQ ID NO: 6350, and a schematic representation of a predicted secondary folding of GAM337274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337274 folded precursor RNA yielding a GAM337274 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337274 RNA, hereby incorporated herein.

GAM337274 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337274 target RNA, herein designated GAM TARGET RNA.

GAM337274 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337274 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337274 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337274 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337274 RNA, herein designated GAM RNA, to target binding sites on GAM337274 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337274 target RNA into GAM337274 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337274 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337274 target genes. The mRNA of each one of this plurality of GAM337274 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337274 RNA, herein designated GAM RNA, and which when bound by GAM337274 RNA causes inhibition of translation of the GAM337274 target mRNA into a corresponding GAM337274 target protein.

The mechanism of the translational inhibition exerted by GAM337274 RNA, herein designated GAM RNA, on one or more GAM337274 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337274 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337274 RNA, herein designated GAM RNA, of GAM337274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337274 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337274 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337274 RNA correlate with, and may be deduced from, the identity of the GAM337274 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337275 6156 CTCACCCGTT Fig. 8 further provides a conceptual description of another novel bioinformatically
CTACTGGCAA detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGGAGTTTG Messenger 337275 (GAM337275) oligonucleotides modulates expression of respective target
TTCAAGAAAT genes whose function and utility is known in the art.

ACCTGAGTTG GAM337275 is a novel bioinformatically detectable regulatory, non protein
GTTCTTTAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337275 was detected
TGTCGAGTTC is described with additional reference to Figs. 9-15.

GATTGTCCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTGGAAGGGT encoded by the human genome.

GGG GAM337275 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337275 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337275 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337275 precursor RNA is designated SEQ ID:6156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6156 is located from position 94819582 to position 94819674 relative to chromosome 15 on the `-` strand.

GAM337275 precursor RNA folds onto itself, forming GAM337275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337275 precursor RNA, designated SEQ ID NO: 6156, and a schematic representation of a predicted secondary folding of GAM337275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337275 folded precursor RNA yielding a GAM337275 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337275 RNA, hereby incorporated herein.

GAM337275 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337275 target RNA, herein designated GAM TARGET RNA.

GAM337275 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337275 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337275 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337275 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337275 RNA, herein designated GAM RNA, to target binding sites on GAM337275 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337275 target RNA into GAM337275 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337275 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337275 target genes. The mRNA of each one of this plurality of GAM337275 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337275 RNA, herein designated GAM RNA, and which when bound by GAM337275 RNA causes inhibition of translation of the GAM337275 target mRNA into a corresponding GAM337275 target protein.

The mechanism of the translational inhibition exerted by GAM337275 RNA, herein designated GAM RNA, on one or more GAM337275 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337275 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337275 RNA, herein designated GAM RNA, of GAM337275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337275 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337275 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337275 RNA correlate with, and may be deduced from, the identity of the GAM337275 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337277 6121 CCTGGAGGCC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTTCCATATT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGATATGTCC Messenger 337277 (GAM337277) oligonucleotides modulates expression of respective target
CCTTCTATAA genes whose function and utility is known in the art.

GTGCAATACA GAM337277 is a novel bioinformatically detectable regulatory, non protein
CTTAATGGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337277 was detected
CCCTCTGTGC is described with additional reference to Figs. 9-15.

TTAGGGAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGTAATCTA encoded by the human genome.

AGCAGAAGGT GAM337277 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TTTTAAGG GAM337277 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337277 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337277 precursor RNA is designated SEQ ID:6121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6121 is located from position 94888202 to position 94888309 relative to chromosome 11 on the `-` strand.

GAM337277 precursor RNA folds onto itself, forming GAM337277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337277 precursor RNA, designated SEQ ID NO: 6121, and a schematic representation of a predicted secondary folding of GAM337277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337277 folded precursor RNA yielding a GAM337277 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337277 RNA, hereby incorporated herein.

GAM337277 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337277 target RNA, herein designated GAM TARGET RNA.

GAM337277 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337277 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337277 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337277 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337277 RNA, herein designated GAM RNA, to target binding sites on GAM337277 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337277 target RNA into GAM337277 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337277 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337277 target genes. The mRNA of each one of this plurality of GAM337277 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337277 RNA, herein designated GAM RNA, and which when bound by GAM337277 RNA causes inhibition of translation of the GAM337277 target mRNA into a corresponding GAM337277 target protein.

The mechanism of the translational inhibition exerted by GAM337277 RNA, herein

designated GAM RNA, on one or more GAM337277 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337277 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337277 RNA, herein designated GAM RNA, of GAM337277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337277 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337277 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337277 RNA correlate with, and may be deduced from, the identity of the GAM337277 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337278 6000 CACGGCTATT Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGTAGCAGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACTGGGCTTG Messenger 337278 (GAM337278) oligonucleotides modulates expression of respective target
AATTCAGATC genes whose function and utility is known in the art.

TGCTTCTCAG GAM337278 is a novel bioinformatically detectable regulatory, non protein
TCCAGTGTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337278 was detected
TCTGCTCTGT is described with additional reference to Figs. 9-15.

AACTGGCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
G encoded by the human genome.

GAM337278 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337278 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337278 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337278 precursor RNA is designated SEQ ID:6000, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6000 is located from position 94917186 to position 94917266

relative to chromosome 8 on the `-` strand.

GAM337278 precursor RNA folds onto itself, forming GAM337278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337278 precursor RNA, designated SEQ ID NO: 6000, and a schematic representation of a predicted secondary folding of GAM337278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337278 folded precursor RNA yielding a GAM337278 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337278 RNA, hereby incorporated herein.

GAM337278 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337278 target RNA, herein designated GAM TARGET RNA.

GAM337278 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337278 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337278 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337278 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337278 RNA, herein designated GAM RNA, to target binding sites on GAM337278 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337278 target RNA into GAM337278 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337278 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337278 target genes. The mRNA of each one of this plurality of GAM337278 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337278 RNA, herein designated GAM RNA, and which when bound by GAM337278 RNA causes inhibition of translation of the GAM337278 target mRNA into a corresponding GAM337278 target protein.

The mechanism of the translational inhibition exerted by GAM337278 RNA, herein designated GAM RNA, on one or more GAM337278 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337278 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337278 RNA, herein designated GAM RNA, of GAM337278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337278 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337278 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337278 RNA correlate with, and may be deduced from, the identity of the GAM337278 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337279 5794 AGGTGATGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGGCATGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGAGGTCAC Messenger 337279 (GAM337279) oligonucleotides modulates expression of respective target

TGTTGGATGT genes whose function and utility is known in the art.

CAGACTGGAG GAM337279 is a novel bioinformatically detectable regulatory, non protein

CCCGACCTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337279 was detected

GTGACTCTCA is described with additional reference to Figs. 9-15.

CCAGGGCCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGACTGTGAG encoded by the human genome.

CCTGGCACCT GAM337279 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337279 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337279 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337279 precursor RNA is designated SEQ ID:5794, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5794 is located from position 95196288 to position 95196387 relative to chromosome 9 on the `+` strand.

GAM337279 precursor RNA folds onto itself, forming GAM337279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337279 precursor RNA, designated SEQ ID NO: 5794, and a schematic representation of a predicted secondary folding of GAM337279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337279 folded precursor RNA yielding a GAM337279 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337279 RNA, hereby incorporated herein.

GAM337279 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337279 target RNA, herein designated GAM TARGET RNA.

GAM337279 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337279 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337279 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337279 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337279 RNA, herein designated GAM RNA, to target binding sites on GAM337279 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337279 target RNA into GAM337279 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337279 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337279 target genes. The mRNA of each one of this plurality of GAM337279 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337279 RNA, herein designated GAM RNA, and which when bound by GAM337279 RNA causes inhibition of translation of the GAM337279 target mRNA into a corresponding GAM337279 target protein.

The mechanism of the translational inhibition exerted by GAM337279 RNA, herein designated GAM RNA, on one or more GAM337279 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337279 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337279 RNA, herein designated GAM RNA, of GAM337279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337279 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337279 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337279 RNA correlate with, and may be deduced from, the identity of the GAM337279 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337281 7129 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGAGGTTG genes whose function and utility is known in the art.

CAGTAAGCCG GAM337281 is a novel bioinformatically detectable regulatory, non protein

AGATCGTGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337281 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAAGTGAG encoded by the human genome.

ATTCCCTCTC GAM337281 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM337281 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337281 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337281 precursor RNA is designated SEQ ID:7129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7129 is located from position 95469300 to position 95469400 relative to chromosome 10 on the `+` strand.

GAM337281 precursor RNA folds onto itself, forming GAM337281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337281 precursor RNA, designated SEQ ID NO: 7129, and a schematic representation of a predicted secondary folding of GAM337281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337281 folded precursor RNA yielding a GAM337281 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337281 RNA, hereby incorporated herein. Expression of GAM337281 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337281 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337281 target RNA, herein designated GAM TARGET RNA.

GAM337281 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337281 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337281 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337281 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337281 RNA, herein designated GAM RNA, to target binding sites on GAM337281 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337281 target RNA into GAM337281 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337281 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337281 target genes. The mRNA of each one of this plurality of GAM337281 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337281 RNA, herein designated GAM RNA, and which when bound by GAM337281 RNA causes inhibition of translation of the GAM337281 target mRNA into a corresponding GAM337281 target protein.

The mechanism of the translational inhibition exerted by GAM337281 RNA, herein designated GAM RNA, on one or more GAM337281 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337281 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337281 RNA, herein designated GAM RNA, of GAM337281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337281 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337281 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337281 RNA correlate with, and may be deduced from, the identity of the GAM337281 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337282 6604 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAGAGGAGG Messenger 337282 (GAM337282) oligonucleotides modulates expression of respective target
TTGCAGTAAG genes whose function and utility is known in the art.

CCGAGATCGT GAM337282 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337282 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGATTCC encoded by the human genome.

GAM337282 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337282 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337282 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337282 precursor RNA is designated SEQ ID:6604, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6604 is located from position 95469307 to position 95469394 relative to chromosome 10 on the `+` strand.

GAM337282 precursor RNA folds onto itself, forming GAM337282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337282 precursor RNA, designated SEQ ID NO: 6604, and a schematic representation of a predicted secondary folding of GAM337282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337282 folded precursor RNA yielding a GAM337282 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337282 RNA, hereby incorporated herein. Expression of GAM337282 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337282 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337282 target RNA, herein designated GAM TARGET RNA.

GAM337282 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337282 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337282 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337282 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337282 RNA, herein designated GAM RNA, to target binding sites on GAM337282 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337282 target RNA into GAM337282 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337282 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337282 target genes. The mRNA of each one of this plurality of GAM337282 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337282 RNA, herein designated GAM RNA, and which when bound by GAM337282 RNA causes inhibition of translation of the GAM337282 target mRNA into a corresponding GAM337282 target protein.

The mechanism of the translational inhibition exerted by GAM337282 RNA, herein designated GAM RNA, on one or more GAM337282 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337282 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337282 RNA, herein designated GAM RNA, of GAM337282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337282 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337282 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337282 RNA correlate with, and may be deduced from, the identity of the GAM337282 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337283 6818 GGGGTATAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
CACTGAGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
CAAACAGGAT Messenger 337283 (GAM337283) oligonucleotides modulates expression of respective target
TCATCTGAGA genes whose function and utility is known in the art.

ACATCGGTTG GAM337283 is a novel bioinformatically detectable regulatory, non protein
CATGTCTCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337283 was detected
TGCTTCAGTG is described with additional reference to Figs. 9-15.

TTCAAGTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CC encoded by the human genome.

GAM337283 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337283 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337283 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337283 precursor RNA is designated SEQ ID:6818, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6818 is located from position 96090585 to position 96090666 relative to chromosome 14 on the `+` strand.

GAM337283 precursor RNA folds onto itself, forming GAM337283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337283 precursor RNA, designated SEQ ID NO: 6818, and a schematic representation of a predicted secondary folding of GAM337283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337283 folded precursor

RNA yielding a GAM337283 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337283 RNA, hereby incorporated herein.

GAM337283 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337283 target RNA, herein designated GAM TARGET RNA.

GAM337283 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337283 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337283 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337283 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337283 RNA, herein designated GAM RNA, to target binding sites on GAM337283 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337283 target RNA into GAM337283 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337283 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337283 target genes. The mRNA of each one of this plurality of GAM337283 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337283 RNA, herein designated GAM RNA, and which when bound by GAM337283 RNA causes inhibition of translation of the GAM337283 target mRNA into a corresponding GAM337283 target protein.

The mechanism of the translational inhibition exerted by GAM337283 RNA, herein designated GAM RNA, on one or more GAM337283 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337283 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337283 RNA, herein designated GAM RNA, of GAM337283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337283 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337283 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337283 RNA correlate with, and may be deduced from, the identity of the GAM337283 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337285 7208 TGCTGTGGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAGTAGAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337285 was detected
TTTTGGAGGA is described with additional reference to Figs. 9-15.

GGTGTGAAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AATGAAGAGT encoded by the human genome.

GACTAGAGGA GAM337285 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AAATAGAGAG GAM337285 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TCAGAAGTTG GAM337285 precursor RNA does not encode a protein. A nucleotide sequence identical or

CAGTA highly similar to the nucleotide sequence of GAM337285 precursor RNA is designated SEQ ID:7208, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7208 is located from position 96668219 to position 96668343 relative to chromosome 13 on the `-` strand.

GAM337285 precursor RNA folds onto itself, forming GAM337285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337285 precursor RNA, designated SEQ ID NO: 7208, and a schematic representation of a predicted secondary folding of GAM337285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337285 folded precursor RNA yielding a GAM337285 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337285 RNA, hereby incorporated herein.

GAM337285 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337285 target RNA, herein designated GAM TARGET RNA.

GAM337285 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337285 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337285 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337285 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337285 RNA, herein designated GAM RNA, to target binding sites on GAM337285 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337285 target RNA into GAM337285 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337285 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337285 target genes. The mRNA of each one of this plurality of GAM337285 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337285 RNA, herein designated GAM RNA, and which when bound by GAM337285 RNA causes inhibition of translation of the GAM337285 target mRNA into a corresponding GAM337285 target protein.

The mechanism of the translational inhibition exerted by GAM337285 RNA, herein

designated GAM RNA, on one or more GAM337285 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337285 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337285 RNA, herein designated GAM RNA, of GAM337285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337285 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337285 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337285 RNA correlate with, and may be deduced from, the identity of the GAM337285 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTTTTCTGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TATATTTTCA Messenger 337286 (GAM337286) oligonucleotides modulates expression of respective target

TGTCAAATAG genes whose function and utility is known in the art.

CAAAAGTAGA GAM337286 is a novel bioinformatically detectable regulatory, non protein

ACTTTTGGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337286 was detected

GAGGTGTGAA is described with additional reference to Figs. 9-15.

GAAATGAAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGACTAGAG encoded by the human genome.

G GAM337286 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337286 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337286 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337286 precursor RNA is designated SEQ ID:6103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6103 is located from position 96668245 to position 96668335

relative to chromosome 13 on the `-` strand.

GAM337286 precursor RNA folds onto itself, forming GAM337286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337286 precursor RNA, designated SEQ ID NO: 6103, and a schematic representation of a predicted secondary folding of GAM337286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337286 folded precursor RNA yielding a GAM337286 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337286 RNA, hereby incorporated herein.

GAM337286 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337286 target RNA, herein designated GAM TARGET RNA.

GAM337286 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337286 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337286 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337286 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337286 RNA, herein designated GAM RNA, to target binding sites on GAM337286 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337286 target RNA into GAM337286 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337286 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337286 target genes. The mRNA of each one of this plurality of GAM337286 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337286 RNA, herein designated GAM RNA, and which when bound by GAM337286 RNA causes inhibition of translation of the GAM337286 target mRNA into a corresponding GAM337286 target protein.

The mechanism of the translational inhibition exerted by GAM337286 RNA, herein designated GAM RNA, on one or more GAM337286 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337286 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337286 RNA, herein designated GAM RNA, of GAM337286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337286 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337286 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337286 RNA correlate with, and may be deduced from, the identity of the GAM337286 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGATGAGGCT GAM337288 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGG GAM337288 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337288 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337288 precursor RNA is designated SEQ ID:6081, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6081 is located from position 96681277 to position 96681379 relative to chromosome 12 on the `-` strand.

GAM337288 precursor RNA folds onto itself, forming GAM337288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337288 precursor RNA, designated SEQ ID NO: 6081, and a schematic representation of a predicted secondary folding of GAM337288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337288 folded precursor RNA yielding a GAM337288 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337288 RNA, hereby incorporated herein.

GAM337288 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337288 target RNA, herein designated GAM TARGET RNA.

GAM337288 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337288 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337288 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337288 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337288 RNA, herein designated GAM RNA, to target binding sites on GAM337288 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337288 target RNA into GAM337288 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337288 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337288 target genes. The mRNA of each one of this plurality of GAM337288 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337288 RNA, herein designated GAM RNA, and which when bound by GAM337288 RNA causes inhibition of translation of the GAM337288 target mRNA into a corresponding GAM337288 target protein.

The mechanism of the translational inhibition exerted by GAM337288 RNA, herein designated GAM RNA, on one or more GAM337288 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337288 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337288 RNA, herein designated GAM RNA, of GAM337288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337288 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337288 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337288 RNA correlate with, and may be deduced from, the identity of the GAM337288 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337289 6080 CCCGCCTCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTCTCGAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CACTGGGATT Messenger 337289 (GAM337289) oligonucleotides modulates expression of respective target

ACAGATGTGA genes whose function and utility is known in the art.

GCCACCATGC GAM337289 is a novel bioinformatically detectable regulatory, non protein

CCAGTTGGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337289 was detected

GCTCTAAACA is described with additional reference to Figs. 9-15.

TTAAATTCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGCAAAGAGA encoded by the human genome.

TGATGAGGCT GAM337289 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GG GAM337289 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337289 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337289 precursor RNA is designated SEQ ID:6080, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6080 is located from position 96681278 to position 96681379 relative to chromosome 12 on the `-` strand.

GAM337289 precursor RNA folds onto itself, forming GAM337289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337289 precursor RNA, designated SEQ ID NO: 6080, and a schematic representation of a predicted secondary folding of GAM337289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337289 folded precursor RNA yielding a GAM337289 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337289 RNA, hereby incorporated herein.

GAM337289 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337289 target RNA, herein designated GAM TARGET RNA.

GAM337289 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337289 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337289 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337289 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337289 RNA, herein designated GAM RNA, to target binding sites on GAM337289 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337289 target RNA into GAM337289 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337289 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337289 target genes. The mRNA of each one of this plurality of GAM337289 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337289 RNA, herein designated GAM RNA, and which when bound by GAM337289 RNA causes inhibition of translation of the GAM337289 target mRNA into a corresponding GAM337289 target protein.

The mechanism of the translational inhibition exerted by GAM337289 RNA, herein designated GAM RNA, on one or more GAM337289 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337289 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337289 RNA, herein designated GAM RNA, of GAM337289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337289 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337289 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337289 RNA correlate with, and may be deduced from, the identity of the GAM337289 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337290 7014 TCATAGTCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CGTTTGTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCCCATCTT Messenger 337290 (GAM337290) oligonucleotides modulates expression of respective target

TTTTGGGAAG genes whose function and utility is known in the art.

TCTTTCCAGG GAM337290 is a novel bioinformatically detectable regulatory, non protein

TATTCACAGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337290 was detected

GACTTGGGCC is described with additional reference to Figs. 9-15.

TCAAACTGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGATGCTGTG encoded by the human genome.

G GAM337290 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337290 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337290 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337290 precursor RNA is designated SEQ ID:7014, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7014 is located from position 96688012 to position 96688102 relative to chromosome X on the `+` strand.

GAM337290 precursor RNA folds onto itself, forming GAM337290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337290 precursor RNA, designated SEQ ID NO: 7014, and a schematic representation of a predicted secondary folding of GAM337290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337290 folded precursor RNA yielding a GAM337290 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337290 RNA, hereby incorporated herein.

GAM337290 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337290 target RNA, herein designated GAM TARGET RNA.

GAM337290 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337290 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337290 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337290 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337290 RNA, herein designated GAM RNA, to target binding sites on GAM337290 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337290 target RNA into GAM337290 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337290 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337290 target genes. The mRNA of each one of this plurality of GAM337290 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337290 RNA, herein designated GAM RNA, and which when bound by GAM337290 RNA causes inhibition of translation of the GAM337290 target mRNA into a corresponding GAM337290 target protein.

The mechanism of the translational inhibition exerted by GAM337290 RNA, herein designated GAM RNA, on one or more GAM337290 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337290 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337290 RNA, herein designated GAM RNA, of GAM337290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337290 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337290 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337290 RNA correlate with, and may be deduced from, the identity of the GAM337290 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGGTTCTGTC is described with additional reference to Figs. 9-15.

ACTTGCCAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATGATCCCA encoded by the human genome.

G GAM337291 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337291 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337291 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337291 precursor RNA is designated SEQ ID:6213, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6213 is located from position 97011857 to position 97011947 relative to chromosome 8 on the `+` strand.

GAM337291 precursor RNA folds onto itself, forming GAM337291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337291 precursor RNA, designated SEQ ID NO: 6213, and a schematic representation of a predicted secondary folding of GAM337291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337291 folded precursor RNA yielding a GAM337291 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337291 RNA, hereby incorporated herein.

GAM337291 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337291 target RNA, herein designated GAM TARGET RNA.

GAM337291 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337291 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337291 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337291 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337291 RNA, herein designated GAM RNA, to target binding sites on GAM337291 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337291 target RNA into GAM337291 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337291 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337291 target genes. The mRNA of each one of this plurality of GAM337291 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337291 RNA, herein designated GAM RNA, and which when bound by GAM337291 RNA causes inhibition of translation of the GAM337291 target mRNA into a corresponding GAM337291 target protein.

The mechanism of the translational inhibition exerted by GAM337291 RNA, herein designated GAM RNA, on one or more GAM337291 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337291 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337291 RNA, herein designated GAM RNA, of GAM337291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337291 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337291 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337291 RNA correlate with, and may be deduced from, the identity of the GAM337291 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337292 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337292 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337292 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337292 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337292 precursor RNA is designated SEQ ID:5906, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5906 is located from position 97029751 to position 97029832 relative to chromosome 5 on the `+` strand.

GAM337292 precursor RNA folds onto itself, forming GAM337292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337292 precursor RNA, designated SEQ ID NO: 5906, and a schematic representation of a predicted secondary folding of GAM337292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337292 folded precursor RNA yielding a GAM337292 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337292 RNA, hereby incorporated herein.

GAM337292 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337292 target RNA, herein designated GAM TARGET RNA.

GAM337292 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337292 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337292 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337292 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337292 RNA, herein designated GAM RNA, to target binding sites on GAM337292 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337292 target RNA into GAM337292 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337292 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337292 target genes. The mRNA of each one of this plurality of GAM337292 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337292 RNA, herein designated GAM RNA, and which when bound by GAM337292 RNA causes inhibition of translation of the GAM337292 target mRNA into a corresponding GAM337292 target protein.

The mechanism of the translational inhibition exerted by GAM337292 RNA, herein designated GAM RNA, on one or more GAM337292 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337292 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337292 RNA, herein designated GAM RNA, of GAM337292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337292 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337292 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337292 RNA correlate with, and may be deduced from, the identity of the GAM337292 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGCTTTGGAA GAM337293 is a novel bioinformatically detectable regulatory, non protein

GTACCCCAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337293 was detected

TAATTCAGTT is described with additional reference to Figs. 9-15.

CTTGACCTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCCAGGGCCA encoded by the human genome.

CACACAT GAM337293 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337293 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337293 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337293 precursor RNA is designated SEQ ID:6929, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6929 is located from position 97153223 to position 97153319 relative to chromosome 15 on the `+` strand.

GAM337293 precursor RNA folds onto itself, forming GAM337293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337293 precursor RNA, designated SEQ ID NO: 6929, and a schematic representation of a predicted secondary folding of GAM337293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337293 folded precursor RNA yielding a GAM337293 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337293 RNA, hereby incorporated herein.

GAM337293 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337293 target RNA, herein designated GAM TARGET RNA.

GAM337293 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337293 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337293 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337293 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337293 RNA, herein designated GAM RNA, to target binding sites on GAM337293 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337293 target RNA into GAM337293 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337293 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337293 target genes. The mRNA of each one of this plurality of GAM337293 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337293 RNA, herein designated GAM RNA, and which when bound by GAM337293 RNA causes inhibition of translation of the GAM337293 target mRNA into a corresponding GAM337293 target protein.

The mechanism of the translational inhibition exerted by GAM337293 RNA, herein designated GAM RNA, on one or more GAM337293 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337293 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337293 RNA, herein designated GAM RNA, of GAM337293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337293 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337293 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337293 RNA correlate with, and may be deduced from, the identity of the GAM337293 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337294 6924 GTGTCTGGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TCCAGGAGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCGTGCTG Messenger 337294 (GAM337294) oligonucleotides modulates expression of respective target

TCTGAAGAGG genes whose function and utility is known in the art.

CTTTGGAAGT GAM337294 is a novel bioinformatically detectable regulatory, non protein

ACCCCAAATA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337294 was detected

ATTCAGTTCT is described with additional reference to Figs. 9-15.

TGACCTGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGGGCCACA encoded by the human genome.

CAC GAM337294 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337294 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337294 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337294 precursor RNA is designated SEQ

ID:6924, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6924 is located from position 97153225 to position 97153317 relative to chromosome 15 on the `+` strand.

GAM337294 precursor RNA folds onto itself, forming GAM337294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337294 precursor RNA, designated SEQ ID NO: 6924, and a schematic representation of a predicted secondary folding of GAM337294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337294 folded precursor RNA yielding a GAM337294 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337294 RNA, hereby incorporated herein.

GAM337294 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337294 target RNA, herein designated GAM TARGET RNA.

GAM337294 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337294 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337294 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337294 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337294 RNA, herein designated GAM RNA, to target binding sites on GAM337294 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337294 target RNA into GAM337294 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337294 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337294 target genes. The mRNA of each one of this plurality of GAM337294 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337294 RNA, herein designated GAM RNA, and which when bound by GAM337294 RNA causes inhibition of translation of the GAM337294 target mRNA into a corresponding GAM337294 target protein.

The mechanism of the translational inhibition exerted by GAM337294 RNA, herein designated GAM RNA, on one or more GAM337294 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337294 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337294 RNA, herein designated GAM RNA, of GAM337294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337294 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337294 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337294 RNA correlate with, and may be deduced from, the identity of the GAM337294 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337296 6281 GAAAGGGAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCACGGAAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGAGAATGG Messenger 337296 (GAM337296) oligonucleotides modulates expression of respective target

AGGAAGAACA genes whose function and utility is known in the art.

GTGCTTTGAG GAM337296 is a novel bioinformatically detectable regulatory, non protein

TGACTGCTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337296 was detected

AGGGTCTTCC is described with additional reference to Figs. 9-15.

TATTATTTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTTCTGAGG encoded by the human genome.

ATTCTCGTTC GAM337296 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337296 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337296 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337296 precursor RNA is designated SEQ ID:6281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6281 is located from position 97963174 to position 97963273 relative to chromosome 13 on the `-` strand.

GAM337296 precursor RNA folds onto itself, forming GAM337296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337296 precursor RNA, designated SEQ ID NO: 6281, and a schematic representation of a predicted secondary folding of GAM337296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337296 folded precursor RNA yielding a GAM337296 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337296 RNA, hereby incorporated herein.

GAM337296 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337296 target RNA, herein designated GAM TARGET RNA.

GAM337296 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337296 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337296 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337296 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337296 RNA, herein designated GAM RNA, to target binding sites on GAM337296 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337296 target RNA into GAM337296 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337296 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337296 target genes. The mRNA of each one of this plurality of GAM337296 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337296 RNA, herein designated GAM RNA, and which when bound by GAM337296 RNA causes inhibition of translation of the GAM337296 target mRNA into a corresponding GAM337296 target protein.

The mechanism of the translational inhibition exerted by GAM337296 RNA, herein designated GAM RNA, on one or more GAM337296 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337296 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337296 RNA, herein designated GAM RNA, of GAM337296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337296 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337296 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337296 RNA correlate with, and may be deduced from, the identity of the GAM337296 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337297 6795 GGGAGTCCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAAGCGTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAATGGAGGA Messenger 337297 (GAM337297) oligonucleotides modulates expression of respective target

AGAACAGTGC genes whose function and utility is known in the art.

TTTGAGTGAC GAM337297 is a novel bioinformatically detectable regulatory, non protein
TGCTGCAGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337297 was detected
TCTTCCTATT is described with additional reference to Figs. 9-15.

ATTTTTAGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTGAGGATTC encoded by the human genome.

TC GAM337297 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337297 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337297 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337297 precursor RNA is designated SEQ ID:6795, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6795 is located from position 97963178 to position 97963269 relative to chromosome 13 on the `-` strand.

GAM337297 precursor RNA folds onto itself, forming GAM337297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337297 precursor RNA, designated SEQ ID NO: 6795, and a schematic representation of a predicted secondary folding of GAM337297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337297 folded precursor RNA yielding a GAM337297 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337297 RNA, hereby incorporated herein.

GAM337297 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337297 target RNA, herein designated GAM TARGET RNA.

GAM337297 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337297 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337297 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337297 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337297 RNA, herein designated GAM RNA, to target binding sites on GAM337297 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337297 target RNA into GAM337297 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337297 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337297 target genes. The mRNA of each one of this plurality of GAM337297 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337297 RNA, herein designated GAM RNA, and which when bound by GAM337297 RNA causes inhibition of translation of the GAM337297 target mRNA into a corresponding GAM337297 target protein.

The mechanism of the translational inhibition exerted by GAM337297 RNA, herein designated GAM RNA, on one or more GAM337297 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337297 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337297 RNA, herein designated GAM RNA, of GAM337297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337297 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337297 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337297 RNA correlate with, and may be deduced from, the identity of the GAM337297 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CGGCCATGCC genes whose function and utility is known in the art.

TTTGTCAGGC GAM337298 is a novel bioinformatically detectable regulatory, non protein
AGGCTGAGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337298 was detected
ACTGGGAGTT is described with additional reference to Figs. 9-15.

AGGAGGGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CC encoded by the human genome.

GAM337298 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337298 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337298 precursor RNA is designated SEQ ID:6747, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6747 is located from position 98182570 to position 98182651 relative to chromosome 15 on the `+` strand.

GAM337298 precursor RNA folds onto itself, forming GAM337298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337298 precursor RNA, designated SEQ ID NO: 6747, and a schematic representation of a predicted secondary folding of GAM337298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337298 folded precursor RNA yielding a GAM337298 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337298 RNA, hereby incorporated herein.

GAM337298 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337298 target RNA, herein designated GAM TARGET RNA.

GAM337298 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337298 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337298 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337298 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337298 RNA, herein designated GAM RNA, to target binding sites on GAM337298 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337298 target RNA into GAM337298 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337298 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337298 target genes. The mRNA of each one of this plurality of GAM337298 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337298 RNA, herein designated GAM RNA, and which when bound by GAM337298 RNA causes inhibition of translation of the GAM337298 target mRNA into a corresponding GAM337298 target protein.

The mechanism of the translational inhibition exerted by GAM337298 RNA, herein designated GAM RNA, on one or more GAM337298 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337298 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337298 RNA, herein designated GAM RNA, of GAM337298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337298 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337298 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337298 RNA correlate with, and may be deduced from, the identity of the GAM337298 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGT GAM337299 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337299 was detected
TCCATCCTGA is described with additional reference to Figs. 9-15.

GTGACAAAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGACTGTCT encoded by the human genome.

CA GAM337299 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337299 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337299 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337299 precursor RNA is designated SEQ ID:7094, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7094 is located from position 98227794 to position 98227885 relative to chromosome 7 on the `+` strand.

GAM337299 precursor RNA folds onto itself, forming GAM337299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337299 precursor RNA, designated SEQ ID NO: 7094, and a schematic representation of a predicted secondary folding of GAM337299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337299 folded precursor RNA yielding a GAM337299 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337299 RNA, hereby incorporated herein.

GAM337299 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337299 target RNA, herein designated GAM TARGET RNA.

GAM337299 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337299 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337299 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337299 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337299 RNA, herein designated GAM RNA, to target binding sites on GAM337299 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337299 target RNA into GAM337299 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337299 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337299 target genes. The mRNA of each one of this plurality of GAM337299 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337299 RNA, herein designated GAM RNA, and which when bound by GAM337299 RNA causes inhibition of translation of the GAM337299 target mRNA into a corresponding GAM337299 target protein.

The mechanism of the translational inhibition exerted by GAM337299 RNA, herein designated GAM RNA, on one or more GAM337299 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337299 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337299 RNA, herein designated GAM RNA, of GAM337299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337299 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337299 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337299 RNA correlate with, and may be deduced from, the identity of the GAM337299 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337300 7315 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically
CCAGGAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTTGCAG Messenger 337300 (GAM337300) oligonucleotides modulates expression of respective target
TGAGCCGAGA genes whose function and utility is known in the art.

TCGTGCCACT GAM337300 is a novel bioinformatically detectable regulatory, non protein
GCACTCCATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337300 was detected
CTGAGTGACA is described with additional reference to Figs. 9-15.

AAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337300 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337300 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337300 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337300 precursor RNA is designated SEQ ID:7315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7315 is located from position 98227800 to position 98227875 relative to chromosome 7 on the `+` strand.

GAM337300 precursor RNA folds onto itself, forming GAM337300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337300 precursor RNA, designated SEQ ID NO: 7315, and a schematic representation of a predicted secondary folding of GAM337300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337300 folded precursor RNA yielding a GAM337300 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337300 RNA, hereby incorporated herein.

GAM337300 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337300 target RNA, herein designated GAM TARGET RNA.

GAM337300 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337300 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337300 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337300 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337300 RNA, herein designated GAM RNA, to target binding sites on GAM337300 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337300 target RNA into GAM337300 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337300 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337300 target genes. The mRNA of each one of this plurality of GAM337300 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337300 RNA, herein designated GAM RNA, and which when bound by GAM337300 RNA causes inhibition of translation of the GAM337300 target mRNA into a corresponding GAM337300 target protein.

The mechanism of the translational inhibition exerted by GAM337300 RNA, herein designated GAM RNA, on one or more GAM337300 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337300 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337300 RNA, herein designated GAM RNA, of GAM337300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337300 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337300 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337300 RNA correlate with, and may be deduced from, the identity of the GAM337300 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337301 5907 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337301 (GAM337301) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337301 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337301 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337301 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337301 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337301 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337301 precursor RNA is designated SEQ ID:5907, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5907 is located from position 98287751 to position 98287832 relative to chromosome 1 on the `-` strand.

GAM337301 precursor RNA folds onto itself, forming GAM337301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337301 precursor RNA, designated SEQ ID NO: 5907, and a schematic representation of a predicted secondary folding of GAM337301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337301 folded precursor RNA yielding a GAM337301 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337301 RNA, hereby incorporated herein.

GAM337301 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337301 target RNA, herein designated GAM TARGET RNA.

GAM337301 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337301 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337301 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337301 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337301 RNA, herein designated GAM RNA, to target binding sites on GAM337301 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337301 target RNA into GAM337301 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337301 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337301 target genes. The mRNA of each one of this plurality of GAM337301 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337301 RNA, herein designated GAM RNA, and which when bound by GAM337301 RNA causes inhibition of translation of the GAM337301 target mRNA into a corresponding GAM337301 target protein.

The mechanism of the translational inhibition exerted by GAM337301 RNA, herein designated GAM RNA, on one or more GAM337301 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337301 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337301 RNA, herein designated GAM RNA, of GAM337301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337301 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337301 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337301 RNA correlate with, and may be deduced from, the identity of the GAM337301 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337302 5908 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337302 (GAM337302) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337302 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337302 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337302 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337302 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337302 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337302 precursor RNA is designated SEQ ID:5908, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:5908 is located from position 98298734 to position 98298815 relative to chromosome 2 on the `-` strand.

GAM337302 precursor RNA folds onto itself, forming GAM337302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337302 precursor RNA, designated SEQ ID NO: 5908, and a schematic representation of a predicted secondary folding of GAM337302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337302 folded precursor RNA yielding a GAM337302 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337302 RNA, hereby incorporated herein.

GAM337302 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337302 target RNA, herein designated GAM TARGET RNA.

GAM337302 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337302 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337302 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337302 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337302 RNA, herein designated GAM RNA, to target binding sites on GAM337302 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337302 target RNA into GAM337302 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337302 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337302 target genes. The mRNA of each one of this plurality of GAM337302 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337302 RNA, herein designated GAM RNA, and which when bound by GAM337302 RNA causes inhibition of translation of the GAM337302 target mRNA into a corresponding GAM337302 target protein.

The mechanism of the translational inhibition exerted by GAM337302 RNA, herein designated GAM RNA, on one or more GAM337302 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337302 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337302 RNA, herein designated GAM RNA, of GAM337302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337302 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337302 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337302 RNA correlate with, and may be deduced from, the identity of the GAM337302 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337303 6688 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 337303 (GAM337303) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM337303 is a novel bioinformatically detectable regulatory, non protein

CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337303 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGACTCT encoded by the human genome.

GAM337303 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337303 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337303 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337303 precursor RNA is designated SEQ ID:6688, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6688 is located from position 98459191 to position 98459277 relative to chromosome X on the `+` strand.

GAM337303 precursor RNA folds onto itself, forming GAM337303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337303 precursor RNA, designated SEQ ID NO: 6688, and a schematic representation of a predicted secondary folding of GAM337303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337303 folded precursor RNA yielding a GAM337303 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337303 RNA, hereby incorporated herein. Expression of GAM337303 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337303 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337303 target RNA, herein designated GAM TARGET RNA.

GAM337303 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337303 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337303 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337303 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337303 RNA, herein designated GAM RNA, to target binding sites on GAM337303 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337303 target RNA into GAM337303 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337303 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337303 target genes. The mRNA of each one of this plurality of GAM337303 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337303 RNA, herein designated GAM RNA, and which when bound by GAM337303 RNA causes inhibition of translation of the GAM337303 target mRNA into a corresponding GAM337303 target protein.

The mechanism of the translational inhibition exerted by GAM337303 RNA, herein designated GAM RNA, on one or more GAM337303 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337303 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337303 RNA, herein designated GAM RNA, of GAM337303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337303 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337303 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337303 RNA correlate with, and may be deduced from, the identity of the GAM337303 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337304 7319 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGGGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 337304 (GAM337304) oligonucleotides modulates expression of respective target

TGAGCCGAGA genes whose function and utility is known in the art.

TCGCCCACTG GAM337304 is a novel bioinformatically detectable regulatory, non protein
CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337304 was detected
TGGGCAACAG is described with additional reference to Figs. 9-15.

AGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337304 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337304 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337304 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337304 precursor RNA is designated SEQ ID:7319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7319 is located from position 98459197 to position 98459271 relative to chromosome X on the `+` strand.

GAM337304 precursor RNA folds onto itself, forming GAM337304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337304 precursor RNA, designated SEQ ID NO: 7319, and a schematic representation of a predicted secondary folding of GAM337304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337304 folded precursor RNA yielding a GAM337304 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337304 RNA, hereby incorporated herein. Expression of GAM337304 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337304 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337304 target RNA, herein designated GAM TARGET RNA.

GAM337304 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337304 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337304 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337304 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337304 RNA, herein designated GAM RNA, to target binding sites on GAM337304 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337304 target RNA into GAM337304 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337304 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337304 target genes. The mRNA of each one of this plurality of GAM337304 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337304 RNA, herein designated GAM RNA, and which when bound by GAM337304 RNA causes inhibition of translation of the GAM337304 target mRNA into a corresponding GAM337304 target protein.

The mechanism of the translational inhibition exerted by GAM337304 RNA, herein designated GAM RNA, on one or more GAM337304 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337304 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337304 RNA, herein designated GAM RNA, of GAM337304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337304 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337304 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337304 RNA correlate with, and may be deduced from, the identity of the GAM337304 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337305 7288 TTATGAATCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AATGTCCAAA Messenger 337305 (GAM337305) oligonucleotides modulates expression of respective target
ATAGGCAAAT genes whose function and utility is known in the art.

CTATGGACAG GAM337305 is a novel bioinformatically detectable regulatory, non protein
AAAGTAGAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337305 was detected
GCAGATTCGT is described with additional reference to Figs. 9-15.

GG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337305 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337305 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337305 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337305 precursor RNA is designated SEQ ID:7288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7288 is located from position 98645765 to position 98645836 relative to chromosome 10 on the `+` strand.

GAM337305 precursor RNA folds onto itself, forming GAM337305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337305 precursor RNA, designated SEQ ID NO: 7288, and a schematic representation of a predicted secondary folding of GAM337305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337305 folded precursor RNA yielding a GAM337305 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337305 RNA, hereby incorporated herein.

GAM337305 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337305 target RNA, herein designated GAM TARGET RNA.

GAM337305 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337305 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337305 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337305 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337305 RNA, herein designated GAM RNA, to target binding sites on GAM337305 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337305 target RNA into GAM337305 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337305 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337305 target genes. The mRNA of each one of this plurality of GAM337305 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337305 RNA, herein designated GAM RNA, and which when bound by GAM337305 RNA causes inhibition of translation of the GAM337305 target mRNA into a corresponding GAM337305 target protein.

The mechanism of the translational inhibition exerted by GAM337305 RNA, herein designated GAM RNA, on one or more GAM337305 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337305 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337305 RNA, herein designated GAM RNA, of GAM337305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337305 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337305 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337305 RNA correlate with, and may be deduced from, the identity of the GAM337305 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337306 5963 ATGAATCCGT TTTTATGAAA TGTCCAAAAT AGGCAAATCT ATGGACAGAA AGTAGAAAGC AGATTCGT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337306 (GAM337306) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337306 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337306 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337306 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337306 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337306 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337306 precursor RNA is designated SEQ ID:5963, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5963 is located from position 98645767 to position 98645834 relative to chromosome 10 on the `+` strand.

GAM337306 precursor RNA folds onto itself, forming GAM337306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337306 precursor RNA, designated SEQ ID NO: 5963, and a schematic representation of a predicted secondary folding of GAM337306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337306 folded precursor RNA yielding a GAM337306 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337306 RNA, hereby incorporated herein.

GAM337306 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337306 target RNA, herein designated GAM TARGET RNA.

GAM337306 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337306 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337306 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337306 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337306 RNA, herein designated GAM RNA, to target binding sites on GAM337306 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337306 target RNA into GAM337306 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337306 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337306 target genes. The mRNA of each one of this plurality of GAM337306 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337306 RNA, herein designated GAM RNA, and which when bound by GAM337306 RNA causes inhibition of translation of the GAM337306 target mRNA into a corresponding GAM337306 target protein.

The mechanism of the translational inhibition exerted by GAM337306 RNA, herein designated GAM RNA, on one or more GAM337306 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337306 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337306 RNA, herein designated GAM RNA, of GAM337306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337306 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337306 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337306 RNA correlate with, and may be deduced from, the identity of the GAM337306 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337310 5909 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337310 (GAM337310) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337310 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337310 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337310 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337310 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337310 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337310 precursor RNA is designated SEQ ID:5909, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5909 is located from position 98924324 to position 98924405 relative to chromosome 5 on the `+` strand.

GAM337310 precursor RNA folds onto itself, forming GAM337310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337310 precursor RNA, designated SEQ ID NO: 5909, and a schematic representation of a predicted secondary folding of GAM337310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337310 folded precursor RNA yielding a GAM337310 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337310 RNA, hereby incorporated herein.

GAM337310 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337310 target RNA, herein designated GAM TARGET RNA.

GAM337310 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337310 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337310 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337310 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337310 RNA, herein designated GAM RNA, to target binding sites on GAM337310 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337310 target RNA into GAM337310 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337310 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337310 target genes. The mRNA of each one of this plurality of GAM337310 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337310 RNA, herein designated GAM RNA, and which when bound by GAM337310 RNA causes inhibition of translation of the GAM337310 target mRNA into a corresponding GAM337310 target protein.

The mechanism of the translational inhibition exerted by GAM337310 RNA, herein designated GAM RNA, on one or more GAM337310 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337310 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337310 RNA, herein designated GAM RNA, of GAM337310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337310 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337310 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337310 RNA correlate with, and may be deduced from, the identity of the GAM337310 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337311 6397 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCGGGAGG Messenger 337311 (GAM337311) oligonucleotides modulates expression of respective target

CGGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCCAA GAM337311 is a novel bioinformatically detectable regulatory, non protein

GATTGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337311 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAACAGCGAA encoded by the human genome.

ACTCTGTCTC GAM337311 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337311 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337311 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337311 precursor RNA is designated SEQ ID:6397, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6397 is located from position 98930879 to position 98930978 relative to chromosome 12 on the `+` strand.

GAM337311 precursor RNA folds onto itself, forming GAM337311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337311 precursor RNA, designated SEQ ID NO: 6397, and a schematic representation of a predicted secondary folding of GAM337311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337311 folded precursor RNA yielding a GAM337311 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337311 RNA, hereby incorporated herein. Expression of GAM337311 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337311 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337311 target RNA, herein designated GAM TARGET RNA.

GAM337311 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337311 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337311 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337311 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337311 RNA, herein designated GAM RNA, to target binding sites on GAM337311 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337311 target RNA into GAM337311 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337311 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337311 target genes. The mRNA of each one of this plurality of GAM337311 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337311 RNA, herein designated GAM RNA, and which when bound by GAM337311 RNA causes inhibition of translation of the GAM337311 target mRNA into a corresponding GAM337311 target protein.

The mechanism of the translational inhibition exerted by GAM337311 RNA, herein designated GAM RNA, on one or more GAM337311 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337311 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337311 RNA, herein designated GAM RNA, of GAM337311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337311 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337311 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337311 RNA correlate with, and may be deduced from, the identity of the GAM337311 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGGTTGTGG genes whose function and utility is known in the art.

TGAGCCAAGA GAM337312 is a novel bioinformatically detectable regulatory, non protein

TTGCGCCATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337312 was detected

GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGCGAAAC encoded by the human genome.

TCTGTC GAM337312 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337312 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337312 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337312 precursor RNA is designated SEQ ID:6733, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6733 is located from position 98930881 to position 98930976 relative to chromosome 12 on the `+` strand.

GAM337312 precursor RNA folds onto itself, forming GAM337312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337312 precursor RNA, designated SEQ ID NO: 6733, and a schematic representation of a predicted secondary folding of GAM337312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337312 folded precursor RNA yielding a GAM337312 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337312 RNA, hereby incorporated herein. Expression of GAM337312 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337312 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337312 target RNA, herein designated GAM TARGET RNA.

GAM337312 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337312 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337312 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337312 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337312 RNA, herein designated GAM RNA, to target binding sites on GAM337312 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337312 target RNA into GAM337312 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337312 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337312 target genes. The mRNA of each one of this plurality of GAM337312 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337312 RNA, herein designated GAM RNA, and which when bound by GAM337312 RNA causes inhibition of translation of the GAM337312 target mRNA into a corresponding GAM337312 target protein.

The mechanism of the translational inhibition exerted by GAM337312 RNA, herein designated GAM RNA, on one or more GAM337312 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337312 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337312 RNA, herein designated GAM RNA, of GAM337312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337312 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337312 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337312 RNA correlate with, and may be deduced from, the identity of the GAM337312 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337313 6650 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGGAGG Messenger 337313 (GAM337313) oligonucleotides modulates expression of respective target

TTGTGGTGAG genes whose function and utility is known in the art.

CCAAGATTGC GAM337313 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337313 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGAAACTCT encoded by the human genome.

GAM337313 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337313 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337313 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337313 precursor RNA is designated SEQ ID:6650, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6650 is located from position 98930885 to position 98930973 relative to chromosome 12 on the `+` strand.

GAM337313 precursor RNA folds onto itself, forming GAM337313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337313 precursor RNA, designated SEQ ID NO: 6650, and a schematic representation of a predicted secondary folding of GAM337313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337313 folded precursor RNA yielding a GAM337313 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337313 RNA, hereby incorporated herein. Expression of GAM337313 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337313 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337313 target RNA, herein designated GAM TARGET RNA.

GAM337313 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337313 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337313 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337313 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337313 RNA, herein designated GAM RNA, to target binding sites on GAM337313 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337313 target RNA into GAM337313 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337313 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337313 target genes. The mRNA of each one of this plurality of GAM337313 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337313 RNA, herein designated GAM RNA, and which when bound by GAM337313 RNA causes inhibition of translation of the GAM337313 target mRNA into a corresponding GAM337313 target protein.

The mechanism of the translational inhibition exerted by GAM337313 RNA, herein designated GAM RNA, on one or more GAM337313 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337313 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337313 RNA, herein designated GAM RNA, of GAM337313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337313 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337313 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337313 RNA correlate with, and may be deduced from, the identity of the GAM337313 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337314 6643 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGGCAGAAG Messenger 337314 (GAM337314) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCAC GAM337314 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337314 was detected
TTCAGCCTGG is described with additional reference to Figs. 9-15.

GTGACAGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGACTCC encoded by the human genome.

GAM337314 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337314 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337314 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337314 precursor RNA is designated SEQ ID:6643, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6643 is located from position 98985382 to position 98985469 relative to chromosome 15 on the `+` strand.

GAM337314 precursor RNA folds onto itself, forming GAM337314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337314 precursor RNA, designated SEQ ID NO: 6643, and a schematic representation of a predicted secondary folding of GAM337314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337314 folded precursor RNA yielding a GAM337314 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337314 RNA, hereby incorporated herein.

GAM337314 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337314 target RNA, herein designated GAM TARGET RNA.

GAM337314 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337314 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337314 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337314 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337314 RNA, herein designated GAM RNA, to target binding sites on GAM337314 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337314 target RNA into GAM337314 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337314 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337314 target genes. The mRNA of each one of this plurality of GAM337314 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337314 RNA, herein designated GAM RNA, and which when bound by GAM337314 RNA causes inhibition of translation of the GAM337314 target mRNA into a corresponding GAM337314 target protein.

The mechanism of the translational inhibition exerted by GAM337314 RNA, herein designated GAM RNA, on one or more GAM337314 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337314 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337314 RNA, herein designated GAM RNA, of GAM337314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337314 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337314 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337314 RNA correlate with, and may be deduced from, the identity of the GAM337314 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAATGTCAAG GAM337315 is a novel bioinformatically detectable regulatory, non protein
AGGTGGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337315 was detected
GTGTGGGGTG is described with additional reference to Figs. 9-15.

GGGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337315 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337315 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337315 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337315 precursor RNA is designated SEQ ID:7250, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7250 is located from position 99006060 to position 99006135 relative to chromosome 14 on the `+` strand.

GAM337315 precursor RNA folds onto itself, forming GAM337315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337315 precursor RNA, designated SEQ ID NO: 7250, and a schematic representation of a predicted secondary folding of GAM337315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337315 folded precursor RNA yielding a GAM337315 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337315 RNA, hereby incorporated herein.

GAM337315 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337315 target RNA, herein designated GAM TARGET RNA.

GAM337315 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337315 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337315 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337315 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337315 RNA, herein designated GAM RNA, to target binding sites on GAM337315 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337315 target RNA into GAM337315 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337315 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337315 target genes. The mRNA of each one of this plurality of GAM337315 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337315 RNA, herein designated GAM RNA, and which when bound by GAM337315 RNA causes inhibition of translation of the GAM337315 target mRNA into a corresponding GAM337315 target protein.

The mechanism of the translational inhibition exerted by GAM337315 RNA, herein designated GAM RNA, on one or more GAM337315 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337315 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337315 RNA, herein designated GAM RNA, of GAM337315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337315 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337315 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337315 RNA correlate with, and may be deduced from, the identity of the GAM337315 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337317 (GAM337317) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337317 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337317 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337317 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337317 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337317 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337317 precursor RNA is designated SEQ ID:6493, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6493 is located from position 99096789 to position 99096891 relative to chromosome 12 on the `+` strand.

GAM337317 precursor RNA folds onto itself, forming GAM337317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337317 precursor RNA, designated SEQ ID NO: 6493, and a schematic representation of a predicted secondary folding of GAM337317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337317 folded precursor RNA yielding a GAM337317 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337317 RNA, hereby incorporated herein.

GAM337317 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337317 target RNA, herein designated GAM TARGET RNA.

GAM337317 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337317 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337317 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337317 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337317 RNA, herein designated GAM RNA, to target binding sites on GAM337317 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337317 target RNA into GAM337317 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337317 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337317 target genes. The mRNA of each one of this plurality of GAM337317 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337317 RNA, herein designated GAM RNA, and which when bound by GAM337317 RNA causes inhibition of translation of the GAM337317 target mRNA into a corresponding GAM337317 target protein.

The mechanism of the translational inhibition exerted by GAM337317 RNA, herein designated GAM RNA, on one or more GAM337317 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337317 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337317 RNA, herein designated GAM RNA, of GAM337317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337317 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337317 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337317 RNA correlate with, and may be deduced from, the identity of the GAM337317 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337318 6495 GCAGGGAGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAGGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AAGGAACAAA Messenger 337318 (GAM337318) oligonucleotides modulates expression of respective target

CTGTTATTTA GAM337318 is a novel bioinformatically detectable regulatory, non protein

TGAAGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337318 was detected

TACATATGTT is described with additional reference to Figs. 9-15.

CTTTCATTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACTCCTGGTG encoded by the human genome.

AAAACCTGC GAM337318 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337318 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337318 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337318 precursor RNA is designated SEQ ID:6495, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6495 is located from position 99096793 to position 99096891 relative to chromosome 12 on the `+` strand.

GAM337318 precursor RNA folds onto itself, forming GAM337318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337318 precursor RNA, designated SEQ ID NO: 6495, and a schematic representation of a predicted secondary folding of GAM337318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337318 folded precursor RNA yielding a GAM337318 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337318 RNA, hereby incorporated herein.

GAM337318 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337318 target RNA, herein designated GAM TARGET RNA.

GAM337318 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337318 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337318 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337318 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337318 RNA, herein designated GAM RNA, to target binding sites on GAM337318 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337318 target RNA into GAM337318 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337318 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337318 target genes. The mRNA of each one of this

plurality of GAM337318 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337318 RNA, herein designated GAM RNA, and which when bound by GAM337318 RNA causes inhibition of translation of the GAM337318 target mRNA into a corresponding GAM337318 target protein.

The mechanism of the translational inhibition exerted by GAM337318 RNA, herein designated GAM RNA, on one or more GAM337318 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337318 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337318 RNA, herein designated GAM RNA, of GAM337318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337318 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337318 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337318 RNA correlate with, and may be deduced from, the identity of the GAM337318 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337319 6790 GGGAGGAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAGGAACAA detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGCTGAACA Messenger 337319 (GAM337319) oligonucleotides modulates expression of respective target

CCTGTTATTT genes whose function and utility is known in the art.

ATGAAGCACT GAM337319 is a novel bioinformatically detectable regulatory, non protein

CTACATATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337319 was detected

TCTTTCATTT is described with additional reference to Figs. 9-15.

CACTCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337319 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337319 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337319 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337319 precursor RNA is designated SEQ ID:6790, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6790 is located from position 99096802 to position 99096878 relative to chromosome 12 on the `+` strand.

GAM337319 precursor RNA folds onto itself, forming GAM337319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337319 precursor RNA, designated SEQ ID NO: 6790, and a schematic representation of a predicted secondary folding of GAM337319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337319 folded precursor RNA yielding a GAM337319 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337319 RNA, hereby incorporated herein.

GAM337319 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337319 target RNA, herein designated GAM TARGET RNA.

GAM337319 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337319 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337319 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337319 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337319 RNA, herein designated GAM RNA, to target binding sites on GAM337319 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337319 target RNA into GAM337319 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337319 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337319 target genes. The mRNA of each one of this plurality of GAM337319 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337319 RNA, herein designated GAM RNA, and which when bound by GAM337319 RNA causes inhibition of translation of the GAM337319 target mRNA into a corresponding GAM337319 target protein.

The mechanism of the translational inhibition exerted by GAM337319 RNA, herein designated GAM RNA, on one or more GAM337319 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337319 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337319 RNA, herein designated GAM RNA, of GAM337319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337319 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337319 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337319 RNA correlate with, and may be deduced from, the identity of the GAM337319 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337320 5657 AACGTGTGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GATTGATGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCATGGACT Messenger 337320 (GAM337320) oligonucleotides modulates expression of respective target

CTGTTGCCCC genes whose function and utility is known in the art.

AAGTCCCCAA GAM337320 is a novel bioinformatically detectable regulatory, non protein

GCCTTGTACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337320 was detected

AGCGTT is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337320 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337320 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337320 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337320 precursor RNA is designated SEQ ID:5657, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5657 is located from position 99149261 to position 99149326 relative to chromosome 13 on the `+` strand.

GAM337320 precursor RNA folds onto itself, forming GAM337320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337320 precursor RNA, designated SEQ ID NO: 5657, and a schematic representation of a predicted secondary folding of GAM337320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337320 folded precursor RNA yielding a GAM337320 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337320 RNA, hereby incorporated herein.

GAM337320 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337320 target RNA, herein designated GAM TARGET RNA.

GAM337320 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337320 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337320 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337320 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337320 RNA, herein designated GAM RNA, to target binding sites on GAM337320 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337320 target RNA into GAM337320 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337320 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337320 target genes. The mRNA of each one of this plurality of GAM337320 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337320 RNA, herein designated GAM RNA, and which when bound by GAM337320 RNA causes inhibition of translation of the GAM337320 target mRNA into a corresponding GAM337320 target protein.

The mechanism of the translational inhibition exerted by GAM337320 RNA, herein designated GAM RNA, on one or more GAM337320 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337320 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337320 RNA, herein designated GAM RNA, of GAM337320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337320 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337320 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337320 RNA correlate with, and may be deduced from, the identity of the GAM337320 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337321 6664 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAATCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGTTGGAGG Messenger 337321 (GAM337321) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGGTCAC GAM337321 is a novel bioinformatically detectable regulatory, non protein
CTGCATTCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337321 was detected
GCCTGCTGAC is described with additional reference to Figs. 9-15.

AGCGAGACTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
C encoded by the human genome.

GAM337321 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337321 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337321 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337321 precursor RNA is designated SEQ ID:6664, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6664 is located from position 99258727 to position 99258807 relative to chromosome 7 on the `+` strand.

GAM337321 precursor RNA folds onto itself, forming GAM337321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337321 precursor RNA, designated SEQ ID NO: 6664, and a schematic representation of a predicted secondary folding of GAM337321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337321 folded precursor RNA yielding a GAM337321 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337321 RNA, hereby incorporated herein.

GAM337321 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337321 target RNA, herein designated GAM TARGET RNA.

GAM337321 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337321 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337321 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337321 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337321 RNA, herein designated GAM RNA, to target binding sites on GAM337321 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337321 target RNA into GAM337321 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337321 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337321 target genes. The mRNA of each one of this plurality of GAM337321 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337321 RNA, herein designated GAM RNA, and which when bound by GAM337321 RNA causes inhibition of translation of the GAM337321 target mRNA into a corresponding GAM337321 target protein.

The mechanism of the translational inhibition exerted by GAM337321 RNA, herein designated GAM RNA, on one or more GAM337321 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337321 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337321 RNA, herein designated GAM RNA, of GAM337321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337321 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337321 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337321 RNA correlate with, and may be deduced from, the identity of the GAM337321 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337324 6645 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGAGATCAT GAM337324 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337324 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAGACTCC encoded by the human genome.

GAM337324 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337324 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337324 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337324 precursor RNA is designated SEQ ID:6645, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6645 is located from position 99463318 to position 99463406 relative to chromosome 14 on the `+` strand.

GAM337324 precursor RNA folds onto itself, forming GAM337324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337324 precursor RNA, designated SEQ ID NO: 6645, and a schematic representation of a predicted secondary folding of GAM337324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337324 folded precursor RNA yielding a GAM337324 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337324 RNA, hereby incorporated herein. Expression of GAM337324 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337324 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337324 target RNA, herein designated GAM TARGET RNA.

GAM337324 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337324 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337324 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337324 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337324 RNA, herein designated GAM RNA, to target binding sites on GAM337324 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337324 target RNA into GAM337324 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337324 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337324 target genes. The mRNA of each one of this plurality of GAM337324 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337324 RNA, herein designated GAM RNA, and which when bound by GAM337324 RNA causes inhibition of translation of the GAM337324 target mRNA into a corresponding GAM337324 target protein.

The mechanism of the translational inhibition exerted by GAM337324 RNA, herein designated GAM RNA, on one or more GAM337324 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337324 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337324 RNA, herein designated GAM RNA, of GAM337324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337324 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337324 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337324 RNA correlate with, and may be deduced from, the identity of the GAM337324 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTAGCCACAT is described with additional reference to Figs. 9-15.

AACTATGCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGCCACGGG encoded by the human genome.

GATATGAATG GAM337326 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CTACTACTAA GAM337326 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TTTTTTCCCT GAM337326 precursor RNA does not encode a protein. A nucleotide sequence identical or

TGAAACAATG highly similar to the nucleotide sequence of GAM337326 precursor RNA is designated SEQ
G ID:7016, and is provided hereinbelow with reference to the sequence listing part.
Nucleotide sequence SEQ ID:7016 is located from position 99654607 to position 99654737 relative to chromosome 11 on the `+` strand.

GAM337326 precursor RNA folds onto itself, forming GAM337326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337326 precursor RNA, designated SEQ ID NO: 7016, and a schematic representation of a predicted secondary folding of GAM337326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337326 folded precursor RNA yielding a GAM337326 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337326 RNA, hereby incorporated herein.

GAM337326 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337326 target RNA, herein designated GAM TARGET RNA.

GAM337326 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337326 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337326 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337326 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337326 RNA, herein designated GAM RNA, to target binding sites on GAM337326 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337326 target RNA into GAM337326 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337326 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337326 target genes. The mRNA of each one of this plurality of GAM337326 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337326 RNA, herein designated GAM RNA, and which when bound by GAM337326 RNA causes inhibition of translation of the GAM337326 target mRNA into a corresponding GAM337326 target protein.

The mechanism of the translational inhibition exerted by GAM337326 RNA, herein designated GAM RNA, on one or more GAM337326 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337326 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337326 RNA, herein designated GAM RNA, of GAM337326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337326 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337326 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337326 RNA correlate with, and may be deduced from, the identity of the GAM337326 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337327 6829 GGTAAGATTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGGCCACCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CATTCAGTCT Messenger 337327 (GAM337327) oligonucleotides modulates expression of respective target

CCTTCACAGC genes whose function and utility is known in the art.

TAAGTGTAGC GAM337327 is a novel bioinformatically detectable regulatory, non protein

CACATAACTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337327 was detected

TGCTTTGGCC is described with additional reference to Figs. 9-15.

ACGGGGATAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAATGCTACT encoded by the human genome.

ACTAATTTTT GAM337327 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCC GAM337327 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337327 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337327 precursor RNA is designated SEQ ID:6829, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6829 is located from position 99654622 to position 99654724 relative to chromosome 11 on the `+` strand.

GAM337327 precursor RNA folds onto itself, forming GAM337327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337327 precursor RNA, designated SEQ ID NO: 6829, and a schematic representation of a predicted secondary folding of GAM337327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337327 folded precursor RNA yielding a GAM337327 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337327 RNA, hereby incorporated herein.

GAM337327 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337327 target RNA, herein designated GAM TARGET RNA.

GAM337327 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337327 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337327 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337327 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337327 RNA, herein designated GAM RNA, to target binding sites on GAM337327 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337327 target RNA into GAM337327 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337327 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337327 target genes. The mRNA of each one of this plurality of GAM337327 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337327 RNA, herein designated GAM RNA, and which when bound by GAM337327 RNA causes inhibition of translation of the GAM337327 target mRNA into a corresponding GAM337327 target protein.

The mechanism of the translational inhibition exerted by GAM337327 RNA, herein designated GAM RNA, on one or more GAM337327 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337327 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337327 RNA, herein designated GAM RNA, of GAM337327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337327 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337327 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337327 RNA correlate with, and may be deduced from, the identity of the GAM337327 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337328 5664 AAGATTGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCACCACAT detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAGTCTCCT Messenger 337328 (GAM337328) oligonucleotides modulates expression of respective target

TCACAGCTAA genes whose function and utility is known in the art.

GTGTAGCCAC GAM337328 is a novel bioinformatically detectable regulatory, non protein

ATAACTATGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337328 was detected

TTTGGCCACG is described with additional reference to Figs. 9-15.

GGGATATGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGCTACTACT encoded by the human genome.

AATTTT GAM337328 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337328 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337328 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337328 precursor RNA is designated SEQ ID:5664, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5664 is located from position 99654625 to position 99654720 relative to chromosome 11 on the `+` strand.

GAM337328 precursor RNA folds onto itself, forming GAM337328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337328 precursor RNA, designated SEQ ID NO: 5664, and a schematic representation of a predicted secondary folding of GAM337328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337328 folded precursor RNA yielding a GAM337328 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337328 RNA, hereby incorporated herein.

GAM337328 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337328 target RNA, herein designated GAM TARGET RNA.

GAM337328 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337328 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337328 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337328 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337328 RNA, herein designated GAM RNA, to target binding sites on GAM337328 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337328 target RNA into GAM337328 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM337328 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337328 target genes. The mRNA of each one of this plurality of GAM337328 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337328 RNA, herein designated GAM RNA, and which when bound by GAM337328 RNA causes inhibition of translation of the GAM337328 target mRNA into a corresponding GAM337328 target protein.

The mechanism of the translational inhibition exerted by GAM337328 RNA, herein designated GAM RNA, on one or more GAM337328 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337328 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337328 RNA, herein designated GAM RNA, of GAM337328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337328 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337328 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337328 RNA correlate with, and may be deduced from, the identity of the GAM337328 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337329 5659 AAGAAGAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAGCTGGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGGACCTCA Messenger 337329 (GAM337329) oligonucleotides modulates expression of respective target

GGATCTCAAG genes whose function and utility is known in the art.

AACATCATGG GAM337329 is a novel bioinformatically detectable regulatory, non protein

AATTGAGTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337329 was detected

CCTGGGTTTT is described with additional reference to Figs. 9-15.

CTTTTTGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

T encoded by the human genome.

GAM337329 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337329 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337329 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337329 precursor RNA is designated SEQ ID:5659, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5659 is located from position 99733672 to position 99733752 relative to chromosome 14 on the `+` strand.

GAM337329 precursor RNA folds onto itself, forming GAM337329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337329 precursor RNA, designated SEQ ID NO: 5659, and a schematic representation of a predicted secondary folding of GAM337329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337329 folded precursor RNA yielding a GAM337329 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337329 RNA, hereby incorporated herein.

GAM337329 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337329 target RNA, herein designated GAM TARGET RNA.

GAM337329 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337329 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337329 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337329 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337329 RNA, herein designated GAM RNA, to target binding sites on GAM337329 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337329 target RNA into GAM337329 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337329 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337329 target genes. The mRNA of each one of this plurality of GAM337329 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337329 RNA, herein designated GAM RNA, and which when bound by GAM337329 RNA causes inhibition of translation of the GAM337329 target mRNA into a corresponding GAM337329 target protein.

The mechanism of the translational inhibition exerted by GAM337329 RNA, herein designated GAM RNA, on one or more GAM337329 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337329 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337329 RNA, herein designated GAM RNA, of GAM337329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337329 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337329 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337329 RNA correlate with, and may be deduced from, the identity of the GAM337329 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337330 5910 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337330 (GAM337330) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337330 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337330 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337330 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337330 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337330 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337330 precursor RNA is designated SEQ ID:5910, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5910 is located from position 100140600 to position 100140681 relative to chromosome 6 on the `-` strand.

GAM337330 precursor RNA folds onto itself, forming GAM337330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337330 precursor RNA, designated SEQ ID NO: 5910, and a schematic representation of a predicted secondary folding of GAM337330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337330 folded precursor RNA yielding a GAM337330 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337330 RNA, hereby incorporated herein.

GAM337330 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337330 target RNA, herein designated GAM TARGET RNA.

GAM337330 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337330 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337330 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337330 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337330 RNA, herein designated GAM RNA, to target binding sites on GAM337330 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337330 target RNA into GAM337330 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337330 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337330 target genes. The mRNA of each one of this plurality of GAM337330 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337330 RNA, herein designated GAM RNA, and which when bound by GAM337330 RNA causes inhibition of translation of the GAM337330 target mRNA into a corresponding GAM337330 target protein.

The mechanism of the translational inhibition exerted by GAM337330 RNA, herein designated GAM RNA, on one or more GAM337330 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337330 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337330 RNA, herein designated GAM RNA, of GAM337330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337330 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337330 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337330 RNA correlate with, and may be deduced from, the identity of the GAM337330 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337331 7135 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCATTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCAGGAG Messenger 337331 (GAM337331) oligonucleotides modulates expression of respective target
GTGGAAGTTG genes whose function and utility is known in the art.

CAGTGAGCTC GAM337331 is a novel bioinformatically detectable regulatory, non protein
AGATCGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337331 was detected
ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAATGA encoded by the human genome.

AACTCCATCT GAM337331 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM337331 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337331 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337331 precursor RNA is designated SEQ ID:7135, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7135 is located from position 100281287 to position 100281388 relative to chromosome 7 on the `+` strand.

GAM337331 precursor RNA folds onto itself, forming GAM337331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337331 precursor RNA, designated SEQ ID NO: 7135, and a schematic representation of a predicted secondary folding of GAM337331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337331 folded precursor RNA yielding a GAM337331 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337331 RNA, hereby incorporated herein.

GAM337331 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337331 target RNA, herein designated GAM TARGET RNA.

GAM337331 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337331 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337331 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337331 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337331 RNA, herein designated GAM RNA, to target binding sites on GAM337331 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337331 target RNA into GAM337331 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337331 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337331 target genes. The mRNA of each one of this plurality of GAM337331 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337331 RNA, herein designated GAM RNA, and which when bound by GAM337331 RNA causes inhibition of translation of the GAM337331 target mRNA into a corresponding GAM337331 target protein.

The mechanism of the translational inhibition exerted by GAM337331 RNA, herein designated GAM RNA, on one or more GAM337331 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337331 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337331 RNA, herein designated GAM RNA, of GAM337331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337331 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337331 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337331 RNA correlate with, and may be deduced from, the identity of the GAM337331 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337333 5911 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337333 (GAM337333) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337333 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337333 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337333 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337333 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337333 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337333 precursor RNA is designated SEQ ID:5911, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5911 is located from position 100558408 to position 100558489 relative to chromosome 1 on the `+` strand.

GAM337333 precursor RNA folds onto itself, forming GAM337333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337333 precursor RNA, designated SEQ ID NO: 5911, and a schematic representation of a predicted secondary folding of GAM337333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337333 folded precursor RNA yielding a GAM337333 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337333 RNA, hereby incorporated herein.

GAM337333 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337333 target RNA, herein designated GAM TARGET RNA.

GAM337333 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337333 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337333 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337333 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337333 RNA, herein designated GAM RNA, to target binding sites on GAM337333 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337333 target RNA into GAM337333 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337333 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337333 target genes. The mRNA of each one of this plurality of GAM337333 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337333 RNA, herein designated GAM RNA, and which when bound by GAM337333 RNA causes inhibition of translation of the GAM337333 target mRNA into a corresponding GAM337333 target protein.

The mechanism of the translational inhibition exerted by GAM337333 RNA, herein designated GAM RNA, on one or more GAM337333 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337333 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337333 RNA, herein designated GAM RNA, of GAM337333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337333 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337333 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337333 RNA correlate with, and may be deduced from, the identity of the GAM337333 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337334 6909 GTGGACTTAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGGTAGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGCTTTGGG Messenger 337334 (GAM337334) oligonucleotides modulates expression of respective target
TGTAGGCCAG genes whose function and utility is known in the art.

GTAAGTTTCT GAM337334 is a novel bioinformatically detectable regulatory, non protein
GGTCTGCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337334 was detected
CATTAGGCAC is described with additional reference to Figs. 9-15.

TTGGTAGCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTAGCTAT encoded by the human genome.

GAM337334 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337334 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337334 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337334 precursor RNA is designated SEQ ID:6909, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6909 is located from position 100644251 to position 100644338 relative to chromosome 14 on the `+` strand.

GAM337334 precursor RNA folds onto itself, forming GAM337334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337334 precursor RNA, designated SEQ ID NO: 6909, and a schematic representation of a predicted secondary folding of GAM337334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337334 folded precursor RNA yielding a GAM337334 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337334 RNA, hereby incorporated herein.

GAM337334 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337334 target RNA, herein designated GAM TARGET RNA.

GAM337334 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337334 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337334 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337334 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337334 RNA, herein designated GAM RNA, to target binding sites on GAM337334 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337334 target RNA into GAM337334 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337334 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337334 target genes. The mRNA of each one of this plurality of GAM337334 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337334 RNA, herein designated GAM RNA, and which when bound by GAM337334 RNA causes inhibition of translation of the GAM337334 target mRNA into a corresponding GAM337334 target protein.

The mechanism of the translational inhibition exerted by GAM337334 RNA, herein designated GAM RNA, on one or more GAM337334 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337334 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337334 RNA, herein designated GAM RNA, of GAM337334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337334 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337334 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337334 RNA correlate with, and may be deduced from, the identity of the GAM337334 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337336 5912 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337336 (GAM337336) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337336 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337336 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337336 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337336 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337336 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337336 precursor RNA is designated SEQ ID:5912, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5912 is located from position 100912899 to position 100912980 relative to chromosome 10 on the `+` strand.

GAM337336 precursor RNA folds onto itself, forming GAM337336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337336 precursor RNA, designated SEQ ID NO: 5912, and a schematic representation of a predicted secondary folding of GAM337336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337336 folded precursor RNA yielding a GAM337336 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337336 RNA, hereby incorporated herein.

GAM337336 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337336 target RNA, herein designated GAM TARGET RNA.

GAM337336 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337336 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337336 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337336 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337336 RNA, herein designated GAM RNA, to target binding sites on GAM337336 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337336 target RNA into GAM337336 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337336 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337336 target genes. The mRNA of each one of this plurality of GAM337336 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337336 RNA, herein designated GAM RNA, and which when bound by GAM337336 RNA causes inhibition of translation of the GAM337336 target mRNA into a corresponding GAM337336 target protein.

The mechanism of the translational inhibition exerted by GAM337336 RNA, herein designated GAM RNA, on one or more GAM337336 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337336 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337336 RNA, herein designated GAM RNA, of GAM337336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337336 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337336 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337336 RNA correlate with, and may be deduced from, the identity of the GAM337336 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337337 6432 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCGGGAGG Messenger 337337 (GAM337337) oligonucleotides modulates expression of respective target

CAGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM337337 is a novel bioinformatically detectable regulatory, non protein

GATTGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337337 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGTGAGA encoded by the human genome.

CTCTGTCTC GAM337337 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337337 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337337 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337337 precursor RNA is designated SEQ

ID:6432, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6432 is located from position 100953716 to position 100953814 relative to chromosome 12 on the `+` strand.

GAM337337 precursor RNA folds onto itself, forming GAM337337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337337 precursor RNA, designated SEQ ID NO: 6432, and a schematic representation of a predicted secondary folding of GAM337337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337337 folded precursor RNA yielding a GAM337337 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337337 RNA, hereby incorporated herein. Expression of GAM337337 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337337 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337337 target RNA, herein designated GAM TARGET RNA.

GAM337337 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337337 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337337 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337337 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337337 RNA, herein designated GAM RNA, to target binding sites on GAM337337 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337337 target RNA

into GAM337337 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337337 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337337 target genes. The mRNA of each one of this plurality of GAM337337 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337337 RNA, herein designated GAM RNA, and which when bound by GAM337337 RNA causes inhibition of translation of the GAM337337 target mRNA into a corresponding GAM337337 target protein.

The mechanism of the translational inhibition exerted by GAM337337 RNA, herein designated GAM RNA, on one or more GAM337337 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337337 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337337 RNA, herein designated GAM RNA, of GAM337337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337337 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337337 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337337 RNA correlate with, and may be deduced from, the identity of the GAM337337 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337341 6895 GTGACTCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATATGAAATC detected oligonucleotides of the present invention, referred to here as Genomic Address

CATTGCCAAG Messenger 337341 (GAM337341) oligonucleotides modulates expression of respective target

GCTGACCTTA genes whose function and utility is known in the art.

TCGTCACTAC GAM337341 is a novel bioinformatically detectable regulatory, non protein

GCCAGAGAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337341 was detected

TGGGATGGAG is described with additional reference to Figs. 9-15.

TCAGCAGAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGGCAAAAT encoded by the human genome.

AGGAACTATG GAM337341 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTCAGCAAGT GAM337341 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

CAC GAM337341 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337341 precursor RNA is designated SEQ ID:6895, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6895 is located from position 101077081 to position 101077193 relative to chromosome 6 on the `-` strand.

GAM337341 precursor RNA folds onto itself, forming GAM337341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337341 precursor RNA, designated SEQ ID NO: 6895, and a schematic representation of a predicted secondary folding of GAM337341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337341 folded precursor RNA yielding a GAM337341 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337341 RNA, hereby incorporated herein. Expression of GAM337341 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337341 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337341 target RNA, herein designated GAM TARGET RNA.

GAM337341 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337341 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337341 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337341 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337341 RNA, herein designated GAM RNA, to target binding sites on GAM337341 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337341 target RNA into GAM337341 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337341 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337341 target genes. The mRNA of each one of this plurality of GAM337341 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337341 RNA, herein designated GAM RNA, and which when bound by GAM337341 RNA causes inhibition of translation of the GAM337341 target mRNA into a corresponding GAM337341 target protein.

The mechanism of the translational inhibition exerted by GAM337341 RNA, herein designated GAM RNA, on one or more GAM337341 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337341 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337341 RNA, herein designated GAM RNA, of GAM337341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337341 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337341 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337341 RNA correlate with, and may be deduced from, the identity of the GAM337341 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337343 5651 AAAGGGGGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTAGTTATAA detected oligonucleotides of the present invention, referred to here as Genomic Address
CCAGGGTCAT Messenger 337343 (GAM337343) oligonucleotides modulates expression of respective target
CTTTGATCTC genes whose function and utility is known in the art.

ATTTGGAAAA GAM337343 is a novel bioinformatically detectable regulatory, non protein
CTTCATTTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337343 was detected
AGATGGAGTT is described with additional reference to Figs. 9-15.

GCAGGTGGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTGGGGACT encoded by the human genome.

GATTCTGCAA GAM337343 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GCCCCTTT GAM337343 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337343 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337343 precursor RNA is designated SEQ ID:5651, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5651 is located from position 101399275 to position 101399382 relative to chromosome 7 on the `+` strand.

GAM337343 precursor RNA folds onto itself, forming GAM337343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337343 precursor RNA, designated SEQ ID NO: 5651, and a schematic representation of a predicted secondary folding of GAM337343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337343 folded precursor RNA yielding a GAM337343 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337343 RNA, hereby incorporated herein.

GAM337343 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337343 target RNA, herein designated GAM TARGET RNA.

GAM337343 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337343 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337343 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337343 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337343 RNA, herein designated GAM RNA, to target binding sites on GAM337343 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337343 target RNA into GAM337343 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337343 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337343 target genes. The mRNA of each one of this plurality of GAM337343 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337343 RNA, herein designated GAM RNA, and which when bound by GAM337343 RNA causes inhibition of translation of the GAM337343 target mRNA into a corresponding GAM337343 target protein.

The mechanism of the translational inhibition exerted by GAM337343 RNA, herein designated GAM RNA, on one or more GAM337343 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337343 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337343 RNA, herein designated GAM RNA, of GAM337343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337343 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337343 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337343 RNA correlate with, and may be deduced from, the identity of the GAM337343 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337344 5913 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337344 (GAM337344) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337344 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337344 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337344 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337344 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337344 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337344 precursor RNA is designated SEQ ID:5913, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5913 is located from position 101536725 to position 101536806 relative to chromosome 13 on the `-` strand.

GAM337344 precursor RNA folds onto itself, forming GAM337344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337344 precursor RNA, designated SEQ ID NO: 5913, and a schematic representation of a predicted secondary folding of GAM337344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337344 folded precursor RNA yielding a GAM337344 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337344 RNA, hereby incorporated herein.

GAM337344 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337344 target RNA, herein designated GAM TARGET RNA.

GAM337344 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337344 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337344 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337344 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337344 RNA, herein designated GAM RNA, to target binding sites on GAM337344 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337344 target RNA into GAM337344 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337344 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337344 target genes. The mRNA of each one of this plurality of GAM337344 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337344 RNA, herein designated GAM RNA, and which when bound by GAM337344 RNA causes inhibition of translation of the GAM337344 target mRNA into a corresponding GAM337344 target protein.

The mechanism of the translational inhibition exerted by GAM337344 RNA, herein designated GAM RNA, on one or more GAM337344 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337344 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337344 RNA, herein designated GAM RNA, of GAM337344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337344 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337344 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337344 RNA correlate with, and may be deduced from, the identity of the GAM337344 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337345 6442 GAGGCTGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTTGAGCCC Messenger 337345 (GAM337345) oligonucleotides modulates expression of respective target
AGGAATTAGA genes whose function and utility is known in the art.

GGCTGCAATG GAM337345 is a novel bioinformatically detectable regulatory, non protein
AGCTATGATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337345 was detected
ATGCCACTGC is described with additional reference to Figs. 9-15.

ACTCCATCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGGAGCAGA encoded by the human genome.

GCTAGACTCT GAM337345 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GTCTC GAM337345 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337345 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337345 precursor RNA is designated SEQ ID:6442, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6442 is located from position 101538287 to position 101538391 relative to chromosome 7 on the `+` strand.

GAM337345 precursor RNA folds onto itself, forming GAM337345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337345 precursor RNA, designated SEQ ID NO: 6442, and a schematic representation of a predicted secondary folding of GAM337345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337345 folded precursor RNA yielding a GAM337345 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337345 RNA, hereby incorporated herein.

GAM337345 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337345 target RNA, herein designated GAM TARGET RNA.

GAM337345 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337345 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337345 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337345 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337345 RNA, herein designated GAM RNA, to target binding sites on GAM337345 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337345 target RNA into GAM337345 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337345 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337345 target genes. The mRNA of each one of this plurality of GAM337345 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337345 RNA, herein designated GAM RNA, and which when bound by GAM337345 RNA causes inhibition of translation of the GAM337345 target mRNA into a corresponding GAM337345 target protein.

The mechanism of the translational inhibition exerted by GAM337345 RNA, herein designated GAM RNA, on one or more GAM337345 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337345 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337345 RNA, herein designated GAM RNA, of GAM337345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337345 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337345 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337345 RNA correlate with, and may be deduced from, the identity of the GAM337345 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATCATGCCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337346 was detected
TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAGCAAGAC encoded by the human genome.

TCTGTCTC GAM337346 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337346 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337346 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337346 precursor RNA is designated SEQ ID:6436, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6436 is located from position 101601185 to position 101601282 relative to chromosome 9 on the `+` strand.

GAM337346 precursor RNA folds onto itself, forming GAM337346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337346 precursor RNA, designated SEQ ID NO: 6436, and a schematic representation of a predicted secondary folding of GAM337346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337346 folded precursor RNA yielding a GAM337346 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337346 RNA, hereby incorporated herein. Expression of GAM337346 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337346 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337346 target RNA, herein designated GAM TARGET RNA.

GAM337346 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337346 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337346 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337346 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337346 RNA, herein designated GAM RNA, to target binding sites on GAM337346 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337346 target RNA into GAM337346 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337346 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337346 target genes. The mRNA of each one of this plurality of GAM337346 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337346 RNA,

herein designated GAM RNA, and which when bound by GAM337346 RNA causes inhibition of translation of the GAM337346 target mRNA into a corresponding GAM337346 target protein.

The mechanism of the translational inhibition exerted by GAM337346 RNA, herein designated GAM RNA, on one or more GAM337346 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337346 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337346 RNA, herein designated GAM RNA, of GAM337346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337346 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337346 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337346 RNA correlate with, and may be deduced from, the identity of the GAM337346 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGCCATGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337350 was detected
TGCGCCACTG is described with additional reference to Figs. 9-15.

CACTCCAGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGGCAACAG encoded by the human genome.

AGCAAGACCC GAM337350 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TGCCCCGCCG GAM337350 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

CCT GAM337350 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337350 precursor RNA is designated SEQ ID:6794, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6794 is located from position 101642187 to position 101642299 relative to chromosome 7 on the `+` strand.

GAM337350 precursor RNA folds onto itself, forming GAM337350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337350 precursor RNA, designated SEQ ID NO: 6794, and a schematic representation of a predicted secondary folding of GAM337350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337350 folded precursor RNA yielding a GAM337350 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337350 RNA, hereby incorporated herein. Expression of GAM337350 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337350 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337350 target RNA, herein designated GAM TARGET RNA.

GAM337350 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337350 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337350 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337350 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337350 RNA, herein designated GAM RNA, to target binding sites on GAM337350 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337350 target RNA into GAM337350 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337350 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337350 target genes. The mRNA of each one of this plurality of GAM337350 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337350 RNA, herein designated GAM RNA, and which when bound by GAM337350 RNA causes inhibition of translation of the GAM337350 target mRNA into a corresponding GAM337350 target protein.

The mechanism of the translational inhibition exerted by GAM337350 RNA, herein designated GAM RNA, on one or more GAM337350 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337350 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337350 RNA, herein designated GAM RNA, of GAM337350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337350 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337350 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337350 RNA correlate with, and may be deduced from, the identity of the GAM337350 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337351 6762 GGCTGAGGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGGATCACT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGAGCCCAGG Messenger 337351 (GAM337351) oligonucleotides modulates expression of respective target
AGTTCAAGGC genes whose function and utility is known in the art.

TGCAGTGAGC GAM337351 is a novel bioinformatically detectable regulatory, non protein
CATGATTGCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337351 was detected
CCACTGCACT is described with additional reference to Figs. 9-15.

CCAGCCTGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAACAGAGCA encoded by the human genome.

AGACCCTGCC GAM337351 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CCGCCGCC GAM337351 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337351 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337351 precursor RNA is designated SEQ ID:6762, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6762 is located from position 101642191 to position 101642298 relative to chromosome 7 on the `+` strand.

GAM337351 precursor RNA folds onto itself, forming GAM337351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337351 precursor RNA, designated SEQ ID NO: 6762, and a schematic representation of a predicted secondary folding of GAM337351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337351 folded precursor RNA yielding a GAM337351 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337351 RNA, hereby incorporated herein. Expression of GAM337351 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337351 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337351 target RNA, herein designated GAM TARGET RNA.

GAM337351 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337351 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337351 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337351 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337351 RNA, herein designated GAM RNA, to target binding sites on GAM337351 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337351 target RNA into GAM337351 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337351 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337351 target genes. The mRNA of each one of this plurality of GAM337351 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337351 RNA, herein designated GAM RNA, and which when bound by GAM337351 RNA causes inhibition of translation of the GAM337351 target mRNA into a corresponding GAM337351 target protein.

The mechanism of the translational inhibition exerted by GAM337351 RNA, herein designated GAM RNA, on one or more GAM337351 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337351 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337351 RNA, herein designated GAM RNA, of GAM337351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337351 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337351 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337351 RNA correlate with, and may be deduced from, the identity of the GAM337351 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGGCTGCAGT genes whose function and utility is known in the art.

GAGCCATGAT GAM337352 is a novel bioinformatically detectable regulatory, non protein
TGCGCCACTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337352 was detected
CACTCCAGCC is described with additional reference to Figs. 9-15.

TGGGCAACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCAAGACCC encoded by the human genome.

TGCCCC GAM337352 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337352 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337352 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337352 precursor RNA is designated SEQ ID:6816, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6816 is located from position 101642197 to position 101642292 relative to chromosome 7 on the `+` strand.

GAM337352 precursor RNA folds onto itself, forming GAM337352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337352 precursor RNA, designated SEQ ID NO: 6816, and a schematic representation of a predicted secondary folding of GAM337352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337352 folded precursor RNA yielding a GAM337352 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337352 RNA, hereby incorporated herein. Expression of GAM337352 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337352 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337352 target RNA, herein designated GAM TARGET RNA.

GAM337352 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337352 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337352 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337352 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337352 RNA, herein designated GAM RNA, to target binding sites on GAM337352 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337352 target RNA into GAM337352 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337352 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337352 target genes. The mRNA of each one of this plurality of GAM337352 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337352 RNA, herein designated GAM RNA, and which when bound by GAM337352 RNA causes inhibition of translation of the GAM337352 target mRNA into a corresponding GAM337352 target protein.

The mechanism of the translational inhibition exerted by GAM337352 RNA, herein designated GAM RNA, on one or more GAM337352 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337352 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337352 RNA, herein designated GAM RNA, of GAM337352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337353 (GAM337353) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337353 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337353 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337353 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337353 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337353 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337353 precursor RNA is designated SEQ ID:6509, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6509 is located from position 101658818 to position 101658891 relative to chromosome 13 on the `-` strand.

GAM337353 precursor RNA folds onto itself, forming GAM337353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337353 precursor RNA, designated SEQ ID NO: 6509, and a schematic representation of a predicted secondary folding of GAM337353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337353 folded precursor RNA yielding a GAM337353 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337353 RNA, hereby incorporated herein.

GAM337353 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337353 target RNA, herein designated GAM TARGET RNA.

GAM337353 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337353 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337353 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337353 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337353 RNA, herein designated GAM RNA, to target binding sites on GAM337353 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337353 target RNA into GAM337353 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337353 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337353 target genes. The mRNA of each one of this plurality of GAM337353 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337353 RNA, herein designated GAM RNA, and which when bound by GAM337353 RNA causes inhibition of translation of the GAM337353 target mRNA into a corresponding GAM337353 target protein.

The mechanism of the translational inhibition exerted by GAM337353 RNA, herein designated GAM RNA, on one or more GAM337353 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337353 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337353 RNA, herein designated GAM RNA, of GAM337353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337353 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337353 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337353 RNA correlate with, and may be deduced from, the identity of the GAM337353 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATGCCACTGC is described with additional reference to Figs. 9-15.

ACTCCATCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGGAGCAGA encoded by the human genome.

GCTAGACTCT GAM337355 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GTCTC GAM337355 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337355 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337355 precursor RNA is designated SEQ ID:6443, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6443 is located from position 101744915 to position 101745019 relative to chromosome 7 on the `-` strand.

GAM337355 precursor RNA folds onto itself, forming GAM337355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337355 precursor RNA, designated SEQ ID NO: 6443, and a schematic representation of a predicted secondary folding of GAM337355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337355 folded precursor RNA yielding a GAM337355 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337355 RNA, hereby incorporated herein.

GAM337355 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337355 target RNA, herein designated GAM TARGET RNA.

GAM337355 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337355 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337355 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337355 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337355 RNA, herein designated GAM RNA, to target binding sites on GAM337355 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337355 target RNA into GAM337355 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337355 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337355 target genes. The mRNA of each one of this plurality of GAM337355 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337355 RNA, herein designated GAM RNA, and which when bound by GAM337355 RNA causes inhibition of translation of the GAM337355 target mRNA into a corresponding GAM337355 target protein.

The mechanism of the translational inhibition exerted by GAM337355 RNA, herein designated GAM RNA, on one or more GAM337355 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337355 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337355 RNA, herein designated GAM RNA, of GAM337355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337355 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337355 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337355 RNA correlate with, and may be deduced from, the identity of the GAM337355 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337356 7012 TCAGTTCTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTATCTGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTCCTACCC Messenger 337356 (GAM337356) oligonucleotides modulates expression of respective target

AGAGATTCTA genes whose function and utility is known in the art.

CCCAGTGAAA GAM337356 is a novel bioinformatically detectable regulatory, non protein

CTCCCACAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337356 was detected

AGCGCAGGTA is described with additional reference to Figs. 9-15.

GATGGGGCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

A encoded by the human genome.

GAM337356 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337356 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337356 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337356 precursor RNA is designated SEQ

ID:7012, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7012 is located from position 101746098 to position 101746178 relative to chromosome 9 on the `+` strand.

GAM337356 precursor RNA folds onto itself, forming GAM337356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337356 precursor RNA, designated SEQ ID NO: 7012, and a schematic representation of a predicted secondary folding of GAM337356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337356 folded precursor RNA yielding a GAM337356 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337356 RNA, hereby incorporated herein.

GAM337356 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337356 target RNA, herein designated GAM TARGET RNA.

GAM337356 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337356 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337356 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337356 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337356 RNA, herein designated GAM RNA, to target binding sites on GAM337356 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337356 target RNA into GAM337356 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337356 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337356 target genes. The mRNA of each one of this plurality of GAM337356 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337356 RNA, herein designated GAM RNA, and which when bound by GAM337356 RNA causes inhibition of translation of the GAM337356 target mRNA into a corresponding GAM337356 target protein.

The mechanism of the translational inhibition exerted by GAM337356 RNA, herein designated GAM RNA, on one or more GAM337356 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337356 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337356 RNA, herein designated GAM RNA, of GAM337356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337356 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337356 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337356 RNA correlate with, and may be deduced from, the identity of the GAM337356 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337357 6444 GAGGCTGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
AAAGAAGATT detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTTGAGCCC Messenger 337357 (GAM337357) oligonucleotides modulates expression of respective target
AGGAATTAGA genes whose function and utility is known in the art.

GGCTGCAATG GAM337357 is a novel bioinformatically detectable regulatory, non protein
AGCTATGATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337357 was detected
ATGCCACTGC is described with additional reference to Figs. 9-15.

ACTCCATCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGGAGCAGA encoded by the human genome.

GCTAGACTCT GAM337357 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GTCTC GAM337357 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337357 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337357 precursor RNA is designated SEQ ID:6444, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6444 is located from position 101843971 to position 101844075 relative to chromosome 7 on the `-` strand.

GAM337357 precursor RNA folds onto itself, forming GAM337357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337357 precursor RNA, designated SEQ ID NO: 6444, and a schematic representation of a predicted secondary folding of GAM337357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337357 folded precursor RNA yielding a GAM337357 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337357 RNA, hereby incorporated herein.

GAM337357 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337357 target RNA, herein designated GAM TARGET RNA.

GAM337357 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337357 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337357 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337357 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337357 RNA, herein designated GAM RNA, to target binding sites on GAM337357 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337357 target RNA into GAM337357 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337357 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337357 target genes. The mRNA of each one of this plurality of GAM337357 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337357 RNA, herein designated GAM RNA, and which when bound by GAM337357 RNA causes inhibition of translation of the GAM337357 target mRNA into a corresponding GAM337357 target protein.

The mechanism of the translational inhibition exerted by GAM337357 RNA, herein designated GAM RNA, on one or more GAM337357 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337357 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337357 RNA, herein designated GAM RNA, of GAM337357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337357 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337357 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337357 RNA correlate with, and may be deduced from, the identity of the GAM337357 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337358 5646 AAAATAAAAT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAAATCATT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTGTCTAGG Messenger 337358 (GAM337358) oligonucleotides modulates expression of respective target

CTTTTGGAGA genes whose function and utility is known in the art.

AGCATATGCT GAM337358 is a novel bioinformatically detectable regulatory, non protein
GTGAAAATGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337358 was detected
TCACGGCTGT is described with additional reference to Figs. 9-15.

GCTCCTAAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCCAGTCATG encoded by the human genome.

TTTCTGTAAC GAM337358 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AGTTTT GAM337358 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337358 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337358 precursor RNA is designated SEQ ID:5646, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5646 is located from position 101964516 to position 101964621 relative to chromosome 14 on the `-` strand.

GAM337358 precursor RNA folds onto itself, forming GAM337358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337358 precursor RNA, designated SEQ ID NO: 5646, and a schematic representation of a predicted secondary folding of GAM337358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337358 folded precursor RNA yielding a GAM337358 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337358 RNA, hereby incorporated herein.

GAM337358 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337358 target RNA, herein designated GAM TARGET RNA.

GAM337358 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337358 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337358 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337358 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337358 RNA, herein designated GAM RNA, to target binding sites on GAM337358 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337358 target RNA into GAM337358 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337358 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337358 target genes. The mRNA of each one of this plurality of GAM337358 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337358 RNA, herein designated GAM RNA, and which when bound by GAM337358 RNA causes inhibition of translation of the GAM337358 target mRNA into a corresponding GAM337358 target protein.

The mechanism of the translational inhibition exerted by GAM337358 RNA, herein designated GAM RNA, on one or more GAM337358 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337358 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337358 RNA, herein designated GAM RNA, of GAM337358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337358 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337358 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337358 RNA correlate with, and may be deduced from, the identity of the GAM337358 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337359 5951 ATAGAAATCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTTTTGGA Messenger 337359 (GAM337359) oligonucleotides modulates expression of respective target
GAAGCATATG genes whose function and utility is known in the art.

CTGTGAAAAT GAM337359 is a novel bioinformatically detectable regulatory, non protein
GATCACGGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337359 was detected
GTGCTCCTAA is described with additional reference to Figs. 9-15.

AAGCCAGTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGTTTCTGT encoded by the human genome.

GAM337359 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337359 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337359 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337359 precursor RNA is designated SEQ ID:5951, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5951 is located from position 101964525 to position 101964613 relative to chromosome 14 on the `-` strand.

GAM337359 precursor RNA folds onto itself, forming GAM337359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337359 precursor RNA, designated SEQ ID NO: 5951, and a schematic representation of a predicted secondary folding of GAM337359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337359 folded precursor RNA yielding a GAM337359 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337359 RNA, hereby incorporated herein.

GAM337359 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337359 target RNA, herein designated GAM TARGET RNA.

GAM337359 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337359 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337359 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337359 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337359 RNA, herein designated GAM RNA, to target binding sites on GAM337359 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337359 target RNA into GAM337359 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337359 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337359 target genes. The mRNA of each one of this plurality of GAM337359 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337359 RNA, herein designated GAM RNA, and which when bound by GAM337359 RNA causes inhibition of translation of the GAM337359 target mRNA into a corresponding GAM337359 target protein.

The mechanism of the translational inhibition exerted by GAM337359 RNA, herein designated GAM RNA, on one or more GAM337359 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337359 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337359 RNA, herein designated GAM RNA, of GAM337359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337359 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337359 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337359 RNA correlate with, and may be deduced from, the identity of the GAM337359 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCTTACACTA is described with additional reference to Figs. 9-15.

AATGGTCCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGTGTTTATG encoded by the human genome.

TGGTTCTGAC GAM337361 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
ACTGCCGTCC GAM337361 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
AG GAM337361 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337361 precursor RNA is designated SEQ ID:6243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6243 is located from position 103489943 to position 103490054 relative to chromosome 10 on the `+` strand.

GAM337361 precursor RNA folds onto itself, forming GAM337361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337361 precursor RNA, designated SEQ ID NO: 6243, and a schematic representation of a predicted secondary folding of GAM337361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337361 folded precursor RNA yielding a GAM337361 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337361 RNA, hereby incorporated herein.

GAM337361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337361 target RNA, herein designated GAM TARGET RNA.

GAM337361 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337361 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337361 RNA, herein designated GAM RNA, to target binding sites on GAM337361 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337361 target RNA into GAM337361 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337361 target genes. The mRNA of each one of this plurality of GAM337361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337361 RNA, herein designated GAM RNA, and which when bound by GAM337361 RNA causes inhibition of translation of the GAM337361 target mRNA into a corresponding GAM337361 target protein.

The mechanism of the translational inhibition exerted by GAM337361 RNA, herein designated GAM RNA, on one or more GAM337361 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337361 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337361 RNA, herein designated GAM RNA, of

GAM337361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337361 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337361 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337361 RNA correlate with, and may be deduced from, the identity of the GAM337361 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337363 5914 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337363 (GAM337363) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337363 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337363 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337363 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337363 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337363 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337363 precursor RNA is designated SEQ ID:5914, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5914 is located from position 103632887 to position 103632968 relative to chromosome 3 on the `+` strand.

GAM337363 precursor RNA folds onto itself, forming GAM337363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337363 precursor RNA, designated SEQ ID NO: 5914, and

a schematic representation of a predicted secondary folding of GAM337363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337363 folded precursor RNA yielding a GAM337363 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337363 RNA, hereby incorporated herein.

GAM337363 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337363 target RNA, herein designated GAM TARGET RNA.

GAM337363 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337363 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337363 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337363 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337363 RNA, herein designated GAM RNA, to target binding sites on GAM337363 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337363 target RNA into GAM337363 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337363 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337363 target genes. The mRNA of each one of this plurality of GAM337363 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337363 RNA, herein designated GAM RNA, and which when bound by GAM337363 RNA causes inhibition of translation of the GAM337363 target mRNA into a corresponding GAM337363 target protein.

The mechanism of the translational inhibition exerted by GAM337363 RNA, herein designated GAM RNA, on one or more GAM337363 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337363 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337363 RNA, herein designated GAM RNA, of GAM337363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337363 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337363 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337363 RNA correlate with, and may be deduced from, the identity of the GAM337363 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337364 6154 CTAGGGTGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTTTTTAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAGGCTCGC Messenger 337364 (GAM337364) oligonucleotides modulates expression of respective target

TCTCTCAGGG genes whose function and utility is known in the art.

GGACCATCCC GAM337364 is a novel bioinformatically detectable regulatory, non protein

GCACTTGCAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337364 was detected

GCCCTTGAGA is described with additional reference to Figs. 9-15.

ATGAGGTCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTTAAATAT encoded by the human genome.

TCACTCTGG GAM337364 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337364 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337364 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337364 precursor RNA is designated SEQ ID:6154, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6154 is located from position 103784499 to position 103784597 relative to chromosome 9 on the `+` strand.

GAM337364 precursor RNA folds onto itself, forming GAM337364 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337364 precursor RNA, designated SEQ ID NO: 6154, and a schematic representation of a predicted secondary folding of GAM337364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337364 folded precursor RNA yielding a GAM337364 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337364 RNA, hereby incorporated herein.

GAM337364 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337364 target RNA, herein designated GAM TARGET RNA.

GAM337364 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337364 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337364 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337364 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337364 RNA, herein designated GAM RNA, to target binding sites on GAM337364 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337364 target RNA into GAM337364 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337364 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337364 target genes. The mRNA of each one of this plurality of GAM337364 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337364 RNA,

herein designated GAM RNA, and which when bound by GAM337364 RNA causes inhibition of translation of the GAM337364 target mRNA into a corresponding GAM337364 target protein.

The mechanism of the translational inhibition exerted by GAM337364 RNA, herein designated GAM RNA, on one or more GAM337364 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337364 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337364 RNA, herein designated GAM RNA, of GAM337364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337364 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337364 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337364 RNA correlate with, and may be deduced from, the identity of the GAM337364 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337366 6502 GCATTGCTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTCCAGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTCAAGGCTG Messenger 337366 (GAM337366) oligonucleotides modulates expression of respective target

CAGTGAGTCA genes whose function and utility is known in the art.

AGGTCATGCC GAM337366 is a novel bioinformatically detectable regulatory, non protein

ACTGCACTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337366 was detected

ATCCTGGGAC is described with additional reference to Figs. 9-15.

AGAGCAAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337366 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337366 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337366 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337366 precursor RNA is designated SEQ ID:6502, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6502 is located from position 104305997 to position 104306075 relative to chromosome 7 on the `+` strand.

GAM337366 precursor RNA folds onto itself, forming GAM337366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337366 precursor RNA, designated SEQ ID NO: 6502, and a schematic representation of a predicted secondary folding of GAM337366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337366 folded precursor RNA yielding a GAM337366 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337366 RNA, hereby incorporated herein.

GAM337366 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337366 target RNA, herein designated GAM TARGET RNA.

GAM337366 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337366 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337366 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337366 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337366 RNA, herein designated GAM RNA, to target binding sites on GAM337366 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337366 target RNA

into GAM337366 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337366 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337366 target genes. The mRNA of each one of this plurality of GAM337366 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337366 RNA, herein designated GAM RNA, and which when bound by GAM337366 RNA causes inhibition of translation of the GAM337366 target mRNA into a corresponding GAM337366 target protein.

The mechanism of the translational inhibition exerted by GAM337366 RNA, herein designated GAM RNA, on one or more GAM337366 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337366 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337366 RNA, herein designated GAM RNA, of GAM337366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337366 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337366 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337366 RNA correlate with, and may be deduced from, the identity of the GAM337366 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CGGTAGGTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAATGAGGT Messenger 337367 (GAM337367) oligonucleotides modulates expression of respective target

CTGTGTCACT genes whose function and utility is known in the art.

GTGGTATTAC GAM337367 is a novel bioinformatically detectable regulatory, non protein

GATATTTTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337367 was detected

CTGGTTATTA is described with additional reference to Figs. 9-15.

TAACCACAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTCACAGAGT encoded by the human genome.

CCATCAAAAA GAM337367 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CCCATGCCTG GAM337367 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

G GAM337367 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337367 precursor RNA is designated SEQ ID:6054, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6054 is located from position 104342178 to position 104342288 relative to chromosome 14 on the `-` strand.

GAM337367 precursor RNA folds onto itself, forming GAM337367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337367 precursor RNA, designated SEQ ID NO: 6054, and a schematic representation of a predicted secondary folding of GAM337367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337367 folded precursor RNA yielding a GAM337367 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337367 RNA, hereby incorporated herein.

GAM337367 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337367 target RNA, herein designated GAM TARGET RNA.

GAM337367 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337367 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337367 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337367 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337367 RNA, herein designated GAM RNA, to target binding sites on GAM337367 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337367 target RNA into GAM337367 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337367 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337367 target genes. The mRNA of each one of this plurality of GAM337367 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337367 RNA, herein designated GAM RNA, and which when bound by GAM337367 RNA causes inhibition of translation of the GAM337367 target mRNA into a corresponding GAM337367 target protein.

The mechanism of the translational inhibition exerted by GAM337367 RNA, herein designated GAM RNA, on one or more GAM337367 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337367 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337367 RNA, herein designated GAM RNA, of GAM337367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337367 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337367 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337367 RNA correlate with, and may be deduced from, the identity of the GAM337367 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337368 6831 GGTAGGTTTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATGAGGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTGTCACTG Messenger 337368 (GAM337368) oligonucleotides modulates expression of respective target

TGGTATTACG genes whose function and utility is known in the art.

ATATTTTGAC GAM337368 is a novel bioinformatically detectable regulatory, non protein
TGGTTATTAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337368 was detected
AACCACAGTG is described with additional reference to Figs. 9-15.

TCACAGAGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CATCAAAAAC encoded by the human genome.

CCATGCC GAM337368 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337368 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337368 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337368 precursor RNA is designated SEQ ID:6831, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6831 is located from position 104342181 to position 104342277 relative to chromosome 14 on the `-` strand.

GAM337368 precursor RNA folds onto itself, forming GAM337368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337368 precursor RNA, designated SEQ ID NO: 6831, and a schematic representation of a predicted secondary folding of GAM337368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337368 folded precursor RNA yielding a GAM337368 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337368 RNA, hereby incorporated herein.

GAM337368 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337368 target RNA, herein designated GAM TARGET RNA.

GAM337368 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337368 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337368 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337368 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337368 RNA, herein designated GAM RNA, to target binding sites on GAM337368 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337368 target RNA into GAM337368 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337368 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337368 target genes. The mRNA of each one of this plurality of GAM337368 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337368 RNA, herein designated GAM RNA, and which when bound by GAM337368 RNA causes inhibition of translation of the GAM337368 target mRNA into a corresponding GAM337368 target protein.

The mechanism of the translational inhibition exerted by GAM337368 RNA, herein designated GAM RNA, on one or more GAM337368 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337368 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337368 RNA, herein designated GAM RNA, of GAM337368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337368 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337368 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337368 RNA correlate with, and may be deduced from, the identity of the GAM337368 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337370 6778 GGGACAGCAT Fig. 8 further provides a conceptual description of another novel bioinformatically
CCTTTTTTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CATTTGTTTG Messenger 337370 (GAM337370) oligonucleotides modulates expression of respective target
TTGCGGGTGG genes whose function and utility is known in the art.

GGAGAGGATT GAM337370 is a novel bioinformatically detectable regulatory, non protein
GAACCCTTAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337370 was detected
CCTCACCTCG is described with additional reference to Figs. 9-15.

CTCGCAAGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCAAGAAAGG encoded by the human genome.

GAACCTGACC GAM337370 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
C GAM337370 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337370 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337370 precursor RNA is designated SEQ ID:6778, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6778 is located from position 104509126 to position 104509226 relative to chromosome 10 on the `+` strand.

GAM337370 precursor RNA folds onto itself, forming GAM337370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337370 precursor RNA, designated SEQ ID NO: 6778, and a schematic representation of a predicted secondary folding of GAM337370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337370 folded precursor RNA yielding a GAM337370 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337370 RNA, hereby incorporated herein.

GAM337370 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337370 target RNA, herein designated GAM TARGET RNA.

GAM337370 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337370 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337370 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337370 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337370 RNA, herein designated GAM RNA, to target binding sites on GAM337370 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337370 target RNA into GAM337370 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337370 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337370 target genes. The mRNA of each one of this plurality of GAM337370 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337370 RNA, herein designated GAM RNA, and which when bound by GAM337370 RNA causes inhibition of translation of the GAM337370 target mRNA into a corresponding GAM337370 target protein.

The mechanism of the translational inhibition exerted by GAM337370 RNA, herein designated GAM RNA, on one or more GAM337370 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337370 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337370 RNA, herein designated GAM RNA, of GAM337370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337370 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337370 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337370 RNA correlate with, and may be deduced from, the identity of the GAM337370 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337371 7027 TCCCCTTCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTTCCCTCC detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGTTGTAAA Messenger 337371 (GAM337371) oligonucleotides modulates expression of respective target

TAACATTTTT genes whose function and utility is known in the art.

TAGCAGCAAT GAM337371 is a novel bioinformatically detectable regulatory, non protein

GTAATCTGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337371 was detected

AAATGTTAGT is described with additional reference to Figs. 9-15.

TGTTTAGGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTCCTGAGA encoded by the human genome.

AAAGGGGA GAM337371 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337371 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337371 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337371 precursor RNA is designated SEQ ID:7027, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7027 is located from position 104616032 to position 104616129 relative to chromosome 12 on the `+` strand.

GAM337371 precursor RNA folds onto itself, forming GAM337371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337371 precursor RNA, designated SEQ ID NO: 7027, and a schematic representation of a predicted secondary folding of GAM337371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337371 folded precursor RNA yielding a GAM337371 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337371 RNA, hereby incorporated herein.

GAM337371 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337371 target RNA, herein designated GAM TARGET RNA.

GAM337371 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337371 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337371 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337371 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337371 RNA, herein designated GAM RNA, to target binding sites on GAM337371 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337371 target RNA into GAM337371 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337371 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337371 target genes. The mRNA of each one of this plurality of GAM337371 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337371 RNA, herein designated GAM RNA, and which when bound by GAM337371 RNA causes inhibition of translation of the GAM337371 target mRNA into a corresponding GAM337371 target protein.

The mechanism of the translational inhibition exerted by GAM337371 RNA, herein designated GAM RNA, on one or more GAM337371 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337371 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337371 RNA, herein designated GAM RNA, of GAM337371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337371 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337371 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337371 RNA correlate with, and may be deduced from, the identity of the GAM337371 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337372 (GAM337372) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337372 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337372 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337372 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337372 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337372 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337372 precursor RNA is designated SEQ ID:6088, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6088 is located from position 104762497 to position 104762573 relative to chromosome 14 on the `-` strand.

GAM337372 precursor RNA folds onto itself, forming GAM337372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337372 precursor RNA, designated SEQ ID NO: 6088, and a schematic representation of a predicted secondary folding of GAM337372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337372 folded precursor RNA yielding a GAM337372 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337372 RNA, hereby incorporated herein.

GAM337372 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337372 target RNA, herein designated GAM TARGET RNA.

GAM337372 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337372 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337372 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337372 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337372 RNA, herein designated GAM RNA, to target binding sites on GAM337372 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337372 target RNA into GAM337372 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337372 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337372 target genes. The mRNA of each one of this plurality of GAM337372 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337372 RNA, herein designated GAM RNA, and which when bound by GAM337372 RNA causes inhibition of translation of the GAM337372 target mRNA into a corresponding GAM337372 target protein.

The mechanism of the translational inhibition exerted by GAM337372 RNA, herein designated GAM RNA, on one or more GAM337372 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337372 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337372 RNA, herein designated GAM RNA, of GAM337372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337372 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337372 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337372 RNA correlate with, and may be deduced from, the identity of the GAM337372 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATGTGGGACT GAM337373 is a novel bioinformatically detectable regulatory, non protein
TTGTCTTCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337373 was detected
CTGACAGTTC is described with additional reference to Figs. 9-15.

CCCAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337373 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337373 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337373 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337373 precursor RNA is designated SEQ ID:6089, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6089 is located from position 104787214 to position 104787290 relative to chromosome 14 on the `-` strand.

GAM337373 precursor RNA folds onto itself, forming GAM337373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337373 precursor RNA, designated SEQ ID NO: 6089, and a schematic representation of a predicted secondary folding of GAM337373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337373 folded precursor RNA yielding a GAM337373 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337373 RNA, hereby incorporated herein.

GAM337373 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337373 target RNA, herein designated GAM TARGET RNA.

GAM337373 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337373 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337373 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337373 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337373 RNA, herein designated GAM RNA, to target binding sites on GAM337373 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337373 target RNA into GAM337373 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337373 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337373 target genes. The mRNA of each one of this

plurality of GAM337373 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337373 RNA, herein designated GAM RNA, and which when bound by GAM337373 RNA causes inhibition of translation of the GAM337373 target mRNA into a corresponding GAM337373 target protein.

The mechanism of the translational inhibition exerted by GAM337373 RNA, herein designated GAM RNA, on one or more GAM337373 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337373 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337373 RNA, herein designated GAM RNA, of GAM337373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337373 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337373 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337373 RNA correlate with, and may be deduced from, the identity of the GAM337373 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTGTTACAT Messenger 337374 (GAM337374) oligonucleotides modulates expression of respective target

TAGTGCTATG genes whose function and utility is known in the art.

ACTGAACATA GAM337374 is a novel bioinformatically detectable regulatory, non protein

AACACTGCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337374 was detected

TAATGGACGG is described with additional reference to Figs. 9-15.

TGAGATCTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGTCATCCT encoded by the human genome.

GAM337374 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337374 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337374 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337374 precursor RNA is designated SEQ ID:6797, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6797 is located from position 104818818 to position 104818907 relative to chromosome 10 on the `+` strand.

GAM337374 precursor RNA folds onto itself, forming GAM337374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337374 precursor RNA, designated SEQ ID NO: 6797, and a schematic representation of a predicted secondary folding of GAM337374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337374 folded precursor RNA yielding a GAM337374 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337374 RNA, hereby incorporated herein.

GAM337374 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337374 target RNA, herein designated GAM TARGET RNA.

GAM337374 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337374 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337374 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337374 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337374 RNA, herein designated GAM RNA, to target binding sites on GAM337374 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337374 target RNA into GAM337374 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337374 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337374 target genes. The mRNA of each one of this plurality of GAM337374 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337374 RNA, herein designated GAM RNA, and which when bound by GAM337374 RNA causes inhibition of translation of the GAM337374 target mRNA into a corresponding GAM337374 target protein.

The mechanism of the translational inhibition exerted by GAM337374 RNA, herein designated GAM RNA, on one or more GAM337374 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337374 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337374 RNA, herein designated GAM RNA, of GAM337374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337374 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337374 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337374 RNA correlate with, and may be deduced from, the identity of the GAM337374 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337375 6183 CTCTTGAACC Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGGAGGTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGTTGGGGT Messenger 337375 (GAM337375) oligonucleotides modulates expression of respective target
GAGCTGAGAT genes whose function and utility is known in the art.

CACTCCATTG GAM337375 is a novel bioinformatically detectable regulatory, non protein
CACTCCAGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337375 was detected
TGGGCAACGA is described with additional reference to Figs. 9-15.

GAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337375 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337375 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337375 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337375 precursor RNA is designated SEQ ID:6183, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6183 is located from position 104911214 to position 104911286 relative to chromosome 8 on the `+` strand.

GAM337375 precursor RNA folds onto itself, forming GAM337375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337375 precursor RNA, designated SEQ ID NO: 6183, and a schematic representation of a predicted secondary folding of GAM337375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337375 folded precursor RNA yielding a GAM337375 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337375 RNA, hereby incorporated herein.

GAM337375 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337375 target RNA, herein designated GAM TARGET RNA.

GAM337375 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337375 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337375 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337375 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337375 RNA, herein designated GAM RNA, to target binding sites on GAM337375 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337375 target RNA into GAM337375 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337375 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337375 target genes. The mRNA of each one of this plurality of GAM337375 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337375 RNA, herein designated GAM RNA, and which when bound by GAM337375 RNA causes inhibition of translation of the GAM337375 target mRNA into a corresponding GAM337375 target protein.

The mechanism of the translational inhibition exerted by GAM337375 RNA, herein designated GAM RNA, on one or more GAM337375 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337375 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337375 RNA, herein designated GAM RNA, of GAM337375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337375 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337375 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337375 RNA correlate with, and may be deduced from, the identity of the GAM337375 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337376 6363 GAGCTGCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CATGGCTAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGAAGCAGG Messenger 337376 (GAM337376) oligonucleotides modulates expression of respective target

TAGGAGAAAT genes whose function and utility is known in the art.

TGGAGAGACT GAM337376 is a novel bioinformatically detectable regulatory, non protein
AGACTTGTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337376 was detected
AGTCTTCCAG is described with additional reference to Figs. 9-15.

CCTCCATCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTCCCATGC encoded by the human genome.

TGGATGCTT GAM337376 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337376 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337376 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337376 precursor RNA is designated SEQ ID:6363, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6363 is located from position 104932380 to position 104932478 relative to chromosome 14 on the `+` strand.

GAM337376 precursor RNA folds onto itself, forming GAM337376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337376 precursor RNA, designated SEQ ID NO: 6363, and a schematic representation of a predicted secondary folding of GAM337376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337376 folded precursor RNA yielding a GAM337376 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337376 RNA, hereby incorporated herein.

GAM337376 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337376 target RNA, herein designated GAM TARGET RNA.

GAM337376 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337376 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337376 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337376 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337376 RNA, herein designated GAM RNA, to target binding sites on GAM337376 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337376 target RNA into GAM337376 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337376 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337376 target genes. The mRNA of each one of this plurality of GAM337376 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337376 RNA, herein designated GAM RNA, and which when bound by GAM337376 RNA causes inhibition of translation of the GAM337376 target mRNA into a corresponding GAM337376 target protein.

The mechanism of the translational inhibition exerted by GAM337376 RNA, herein designated GAM RNA, on one or more GAM337376 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337376 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337376 RNA, herein designated GAM RNA, of GAM337376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337376 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337376 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337376 RNA correlate with, and may be deduced from, the identity of the GAM337376 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TAGGTAACTG Messenger 337379 (GAM337379) oligonucleotides modulates expression of respective target

CTTTTGTTGT genes whose function and utility is known in the art.

GCAGGGACTG GAM337379 is a novel bioinformatically detectable regulatory, non protein

GTGTACCACA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337379 was detected

GCACACCTCC is described with additional reference to Figs. 9-15.

TCCCGCCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTAAAGCAG encoded by the human genome.

CTGACCGCGT GAM337379 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAAGGGGA GAM337379 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337379 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337379 precursor RNA is designated SEQ ID:7040, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7040 is located from position 105338344 to position 105338451 relative to chromosome 9 on the `-` strand.

GAM337379 precursor RNA folds onto itself, forming GAM337379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337379 precursor RNA, designated SEQ ID NO: 7040, and a schematic representation of a predicted secondary folding of GAM337379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337379 folded precursor RNA yielding a GAM337379 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337379 RNA, hereby incorporated herein.

GAM337379 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337379 target RNA, herein designated GAM TARGET RNA.

GAM337379 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337379 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337379 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337379 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337379 RNA, herein designated GAM RNA, to target binding sites on GAM337379 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337379 target RNA into GAM337379 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337379 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337379 target genes. The mRNA of each one of this plurality of GAM337379 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337379 RNA, herein designated GAM RNA, and which when bound by GAM337379 RNA causes inhibition of translation of the GAM337379 target mRNA into a corresponding GAM337379 target protein.

The mechanism of the translational inhibition exerted by GAM337379 RNA, herein designated GAM RNA, on one or more GAM337379 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337379 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337379 RNA, herein designated GAM RNA, of GAM337379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337379 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337379 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337379 RNA correlate with, and may be deduced from, the identity of the GAM337379 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337380 6654 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGGAGG Messenger 337380 (GAM337380) oligonucleotides modulates expression of respective target

TTGCGGGGAG genes whose function and utility is known in the art.

CCAAGATCGC GAM337380 is a novel bioinformatically detectable regulatory, non protein

ACCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337380 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGAAACTCC encoded by the human genome.

GAM337380 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337380 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337380 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337380 precursor RNA is designated SEQ ID:6654, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6654 is located from position 105566898 to position 105566986 relative to chromosome 2 on the `+` strand.

GAM337380 precursor RNA folds onto itself, forming GAM337380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337380 precursor RNA, designated SEQ ID NO: 6654, and a schematic representation of a predicted secondary folding of GAM337380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337380 folded precursor RNA yielding a GAM337380 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337380 RNA, hereby incorporated herein. Expression of GAM337380 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337380 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337380 target RNA, herein designated GAM TARGET RNA.

GAM337380 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337380 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337380 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337380 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337380 RNA, herein designated GAM RNA, to target binding sites on GAM337380 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337380 target RNA into GAM337380 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337380 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337380 target genes. The mRNA of each one of this plurality of GAM337380 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337380 RNA, herein designated GAM RNA, and which when bound by GAM337380 RNA causes inhibition of translation of the GAM337380 target mRNA into a corresponding GAM337380 target protein.

The mechanism of the translational inhibition exerted by GAM337380 RNA, herein designated GAM RNA, on one or more GAM337380 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337380 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337380 RNA, herein designated GAM RNA, of GAM337380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337380 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337380 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337380 RNA correlate with, and may be deduced from, the identity of the GAM337380 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337383 7036 TCCTACAACT Fig. 8 further provides a conceptual description of another novel bioinformatically
TGAGTCTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
ATACTGGTGT Messenger 337383 (GAM337383) oligonucleotides modulates expression of respective target
CACTTTCAGG genes whose function and utility is known in the art.

AGCTCTAAGA GAM337383 is a novel bioinformatically detectable regulatory, non protein
ATACGTCAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337383 was detected
TCTCGCTTCT is described with additional reference to Figs. 9-15.

GAGTTGGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCCCTCAACC encoded by the human genome.

AAGAAAGGA GAM337383 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337383 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337383 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337383 precursor RNA is designated SEQ ID:7036, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7036 is located from position 106366445 to position 106366543 relative to chromosome 10 on the `-` strand.

GAM337383 precursor RNA folds onto itself, forming GAM337383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337383 precursor RNA, designated SEQ ID NO: 7036, and a schematic representation of a predicted secondary folding of GAM337383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337383 folded precursor RNA yielding a GAM337383 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337383 RNA, hereby incorporated herein.

GAM337383 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337383 target RNA, herein designated GAM TARGET RNA.

GAM337383 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337383 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337383 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337383 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337383 RNA, herein designated GAM RNA, to target binding sites on GAM337383 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337383 target RNA into GAM337383 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337383 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337383 target genes. The mRNA of each one of this plurality of GAM337383 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337383 RNA, herein designated GAM RNA, and which when bound by GAM337383 RNA causes inhibition of translation of the GAM337383 target mRNA into a corresponding GAM337383 target protein.

The mechanism of the translational inhibition exerted by GAM337383 RNA, herein designated GAM RNA, on one or more GAM337383 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337383 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337383 RNA, herein designated GAM RNA, of GAM337383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337383 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337383 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337383 RNA correlate with, and may be deduced from, the identity of the GAM337383 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337384 6786 GGGAGCAAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAGGGGTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTAGTGCTC Messenger 337384 (GAM337384) oligonucleotides modulates expression of respective target

CTCTTTTCCC genes whose function and utility is known in the art.

CTGAAATCAC GAM337384 is a novel bioinformatically detectable regulatory, non protein
ACAAGAATGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337384 was detected
GGAGGGCTTT is described with additional reference to Figs. 9-15.

CCCTGACTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCAAAGACTC encoded by the human genome.

CCTCCC GAM337384 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337384 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337384 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337384 precursor RNA is designated SEQ ID:6786, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6786 is located from position 106504624 to position 106504719 relative to chromosome 12 on the `+` strand.

GAM337384 precursor RNA folds onto itself, forming GAM337384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337384 precursor RNA, designated SEQ ID NO: 6786, and a schematic representation of a predicted secondary folding of GAM337384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337384 folded precursor RNA yielding a GAM337384 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337384 RNA, hereby incorporated herein.

GAM337384 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337384 target RNA, herein designated GAM TARGET RNA.

GAM337384 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337384 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337384 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337384 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337384 RNA, herein designated GAM RNA, to target binding sites on GAM337384 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337384 target RNA into GAM337384 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337384 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337384 target genes. The mRNA of each one of this plurality of GAM337384 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337384 RNA, herein designated GAM RNA, and which when bound by GAM337384 RNA causes inhibition of translation of the GAM337384 target mRNA into a corresponding GAM337384 target protein.

The mechanism of the translational inhibition exerted by GAM337384 RNA, herein designated GAM RNA, on one or more GAM337384 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337384 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337384 RNA, herein designated GAM RNA, of GAM337384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337384 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337384 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337384 RNA correlate with, and may be deduced from, the identity of the GAM337384 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AACTCGGGAG Messenger 337385 (GAM337385) oligonucleotides modulates expression of respective target
GGGAGGCTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM337385 is a novel bioinformatically detectable regulatory, non protein
GATCACACAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337385 was detected
CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAAAGTGA encoded by the human genome.

GACCCCCATC GAM337385 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TCA GAM337385 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337385 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337385 precursor RNA is designated SEQ ID:7180, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7180 is located from position 106622467 to position 106622569 relative to chromosome 2 on the `-` strand.

GAM337385 precursor RNA folds onto itself, forming GAM337385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337385 precursor RNA, designated SEQ ID NO: 7180, and a schematic representation of a predicted secondary folding of GAM337385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337385 folded precursor RNA yielding a GAM337385 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337385 RNA, hereby incorporated herein. Expression of GAM337385 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337385 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337385 target RNA, herein designated GAM TARGET RNA.

GAM337385 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337385 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337385 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337385 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337385 RNA, herein designated GAM RNA, to target binding sites on GAM337385 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337385 target RNA into GAM337385 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337385 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337385 target genes. The mRNA of each one of this plurality of GAM337385 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337385 RNA, herein designated GAM RNA, and which when bound by GAM337385 RNA causes inhibition of translation of the GAM337385 target mRNA into a corresponding GAM337385 target protein.

The mechanism of the translational inhibition exerted by GAM337385 RNA, herein designated GAM RNA, on one or more GAM337385 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337385 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337385 RNA, herein designated GAM RNA, of GAM337385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337385 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337385 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337385 RNA correlate with, and may be deduced from, the identity of the GAM337385 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACA GAM337386 is a novel bioinformatically detectable regulatory, non protein
CACCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337386 was detected
CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAGACC encoded by the human genome.

GAM337386 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337386 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337386 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337386 precursor RNA is designated SEQ ID:6658, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6658 is located from position 106622476 to position 106622562 relative to chromosome 2 on the `-` strand.

GAM337386 precursor RNA folds onto itself, forming GAM337386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337386 precursor RNA, designated SEQ ID NO: 6658, and a schematic representation of a predicted secondary folding of GAM337386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337386 folded precursor

RNA yielding a GAM337386 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337386 RNA, hereby incorporated herein. Expression of GAM337386 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337386 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337386 target RNA, herein designated GAM TARGET RNA.

GAM337386 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337386 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337386 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337386 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337386 RNA, herein designated GAM RNA, to target binding sites on GAM337386 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337386 target RNA into GAM337386 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337386 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337386 target genes. The mRNA of each one of this plurality of GAM337386 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337386 RNA, herein designated GAM RNA, and which when bound by GAM337386 RNA causes inhibition of translation of the GAM337386 target mRNA into a corresponding GAM337386 target protein.

The mechanism of the translational inhibition exerted by GAM337386 RNA, herein designated GAM RNA, on one or more GAM337386 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337386 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337386 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337386 RNA, herein designated GAM RNA, of GAM337386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337386 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337386 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337386 RNA correlate with, and may be deduced from, the identity of the GAM337386 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337387 7054 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGGGAGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCTGCAGT Messenger 337387 (GAM337387) oligonucleotides modulates expression of respective target

GAGCCAAGAT genes whose function and utility is known in the art.

CACACACCAC GAM337387 is a novel bioinformatically detectable regulatory, non protein

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337387 was detected

CCTGGGCAAC is described with additional reference to Figs. 9-15.

AAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337387 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337387 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337387 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337387 precursor RNA is designated SEQ ID:7054, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7054 is located from position 106622480 to position 106622556 relative to chromosome 2 on the `-` strand.

GAM337387 precursor RNA folds onto itself, forming GAM337387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337387 precursor RNA, designated SEQ ID NO: 7054, and a schematic representation of a predicted secondary folding of GAM337387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337387 folded precursor RNA yielding a GAM337387 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337387 RNA, hereby incorporated herein. Expression of GAM337387 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337387 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337387 target RNA, herein designated GAM TARGET RNA.

GAM337387 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337387 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337387 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337387 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337387 RNA, herein designated GAM RNA, to target binding sites on GAM337387 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337387 target RNA into GAM337387 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337387 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337387 target genes. The mRNA of each one of this plurality of GAM337387 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337387 RNA, herein designated GAM RNA, and which when bound by GAM337387 RNA causes inhibition of translation of the GAM337387 target mRNA into a corresponding GAM337387 target protein.

The mechanism of the translational inhibition exerted by GAM337387 RNA, herein designated GAM RNA, on one or more GAM337387 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337387 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337387 RNA, herein designated GAM RNA, of GAM337387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337387 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337387 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337387 RNA correlate with, and may be deduced from, the identity of the GAM337387 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337388 6033 CATAATGAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCACAGCCTC detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGGGACGAT Messenger 337388 (GAM337388) oligonucleotides modulates expression of respective target

TGTTCCTGTT genes whose function and utility is known in the art.

TCTGTAGAAT GAM337388 is a novel bioinformatically detectable regulatory, non protein

TGATTTGAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337388 was detected

CTTGAATAAT is described with additional reference to Figs. 9-15.

GTCCCACTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGGCAAGGT encoded by the human genome.

GATCATAAAT GAM337388 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

G GAM337388 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337388 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337388 precursor RNA is designated SEQ ID:6033, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6033 is located from position 106717983 to position 106718083 relative to chromosome 8 on the `-` strand.

GAM337388 precursor RNA folds onto itself, forming GAM337388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337388 precursor RNA, designated SEQ ID NO: 6033, and a schematic representation of a predicted secondary folding of GAM337388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337388 folded precursor RNA yielding a GAM337388 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337388 RNA, hereby incorporated herein.

GAM337388 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337388 target RNA, herein designated GAM TARGET RNA.

GAM337388 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337388 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337388 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337388 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337388 RNA, herein designated GAM RNA, to target binding sites on GAM337388 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337388 target RNA into GAM337388 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM337388 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337388 target genes. The mRNA of each one of this plurality of GAM337388 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337388 RNA, herein designated GAM RNA, and which when bound by GAM337388 RNA causes inhibition of translation of the GAM337388 target mRNA into a corresponding GAM337388 target protein.

The mechanism of the translational inhibition exerted by GAM337388 RNA, herein designated GAM RNA, on one or more GAM337388 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337388 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337388 RNA, herein designated GAM RNA, of GAM337388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337388 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337388 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337388 RNA correlate with, and may be deduced from, the identity of the GAM337388 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337389 5967 ATGAGTCCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGCCTCGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GACGATTGTT Messenger 337389 (GAM337389) oligonucleotides modulates expression of respective target

CCTGTTTCTG genes whose function and utility is known in the art.

TAGAATTGAT GAM337389 is a novel bioinformatically detectable regulatory, non protein

TTGAAACTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337389 was detected

AATAATGTCC is described with additional reference to Figs. 9-15.

CACTGGGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGGTGATC encoded by the human genome.

AT GAM337389 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337389 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337389 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337389 precursor RNA is designated SEQ ID:5967, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5967 is located from position 106717988 to position 106718079 relative to chromosome 8 on the `-` strand.

GAM337389 precursor RNA folds onto itself, forming GAM337389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337389 precursor RNA, designated SEQ ID NO: 5967, and a schematic representation of a predicted secondary folding of GAM337389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337389 folded precursor RNA yielding a GAM337389 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337389 RNA, hereby incorporated herein.

GAM337389 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337389 target RNA, herein designated GAM TARGET RNA.

GAM337389 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337389 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337389 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337389 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337389 RNA, herein designated GAM RNA, to target binding sites on GAM337389 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337389 target RNA into GAM337389 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337389 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337389 target genes. The mRNA of each one of this plurality of GAM337389 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337389 RNA, herein designated GAM RNA, and which when bound by GAM337389 RNA causes inhibition of translation of the GAM337389 target mRNA into a corresponding GAM337389 target protein.

The mechanism of the translational inhibition exerted by GAM337389 RNA, herein designated GAM RNA, on one or more GAM337389 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337389 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337389 RNA, herein designated GAM RNA, of GAM337389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337389 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337389 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337389 RNA correlate with, and may be deduced from, the identity of the GAM337389 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337390 6062 CCATGCTAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TAAAGGAGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

CTTAGGTAGA Messenger 337390 (GAM337390) oligonucleotides modulates expression of respective target

CAGACTTGAC genes whose function and utility is known in the art.

CTTGGAGAGG GAM337390 is a novel bioinformatically detectable regulatory, non protein
CCAGAGAAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337390 was detected
CTTCTCTGAG is described with additional reference to Figs. 9-15.

GACAGAAAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGTGCTGAA encoded by the human genome.

GTCTGAAGTG GAM337390 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TAAGTAGG GAM337390 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337390 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337390 precursor RNA is designated SEQ ID:6062, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6062 is located from position 106800362 to position 106800469 relative to chromosome 9 on the `+` strand.

GAM337390 precursor RNA folds onto itself, forming GAM337390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337390 precursor RNA, designated SEQ ID NO: 6062, and a schematic representation of a predicted secondary folding of GAM337390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337390 folded precursor RNA yielding a GAM337390 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337390 RNA, hereby incorporated herein.

GAM337390 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337390 target RNA, herein designated GAM TARGET RNA.

GAM337390 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337390 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337390 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337390 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337390 RNA, herein designated GAM RNA, to target binding sites on GAM337390 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337390 target RNA into GAM337390 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337390 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337390 target genes. The mRNA of each one of this plurality of GAM337390 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337390 RNA, herein designated GAM RNA, and which when bound by GAM337390 RNA causes inhibition of translation of the GAM337390 target mRNA into a corresponding GAM337390 target protein.

The mechanism of the translational inhibition exerted by GAM337390 RNA, herein designated GAM RNA, on one or more GAM337390 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337390 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337390 RNA, herein designated GAM RNA, of GAM337390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337390 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337390 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337390 RNA correlate with, and may be deduced from, the identity of the GAM337390 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337391 5728 AGAGCTTAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TAGACAGACT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGACCTTGGA Messenger 337391 (GAM337391) oligonucleotides modulates expression of respective target
GAGGCCAGAG genes whose function and utility is known in the art.

AAGCCTTCTC GAM337391 is a novel bioinformatically detectable regulatory, non protein
TGAGGACAGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337391 was detected
AAGTTTGTGC is described with additional reference to Figs. 9-15.

TGAAGTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337391 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337391 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337391 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337391 precursor RNA is designated SEQ ID:5728, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5728 is located from position 106800378 to position 106800455 relative to chromosome 9 on the `+` strand.

GAM337391 precursor RNA folds onto itself, forming GAM337391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337391 precursor RNA, designated SEQ ID NO: 5728, and a schematic representation of a predicted secondary folding of GAM337391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337391 folded precursor RNA yielding a GAM337391 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337391 RNA, hereby incorporated herein.

GAM337391 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337391 target RNA, herein designated GAM TARGET RNA.

GAM337391 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337391 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337391 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337391 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337391 RNA, herein designated GAM RNA, to target binding sites on GAM337391 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337391 target RNA into GAM337391 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337391 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337391 target genes. The mRNA of each one of this plurality of GAM337391 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337391 RNA, herein designated GAM RNA, and which when bound by GAM337391 RNA causes inhibition of translation of the GAM337391 target mRNA into a corresponding GAM337391 target protein.

The mechanism of the translational inhibition exerted by GAM337391 RNA, herein designated GAM RNA, on one or more GAM337391 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337391 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337391 RNA, herein designated GAM RNA, of GAM337391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337391 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337391 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337391 RNA correlate with, and may be deduced from, the identity of the GAM337391 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337393 6682 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GACGTGGAGG Messenger 337393 (GAM337393) oligonucleotides modulates expression of respective target
TTGCCATGAG genes whose function and utility is known in the art.

CTGAGATCAC GAM337393 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337393 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGAAACTCC encoded by the human genome.

GAM337393 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337393 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337393 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337393 precursor RNA is designated SEQ ID:6682, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6682 is located from position 107416407 to position 107416495 relative to chromosome 11 on the `-` strand.

GAM337393 precursor RNA folds onto itself, forming GAM337393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337393 precursor RNA, designated SEQ ID NO: 6682, and a schematic representation of a predicted secondary folding of GAM337393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337393 folded precursor RNA yielding a GAM337393 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337393 RNA, hereby incorporated herein. Expression of GAM337393 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337393 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337393 target RNA, herein designated GAM TARGET RNA.

GAM337393 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337393 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337393 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337393 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337393 RNA, herein designated GAM RNA, to target binding sites on GAM337393 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337393 target RNA into GAM337393 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337393 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337393 target genes. The mRNA of each one of this plurality of GAM337393 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337393 RNA, herein designated GAM RNA, and which when bound by GAM337393 RNA causes inhibition of translation of the GAM337393 target mRNA into a corresponding GAM337393 target protein.

The mechanism of the translational inhibition exerted by GAM337393 RNA, herein designated GAM RNA, on one or more GAM337393 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337393 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337393 RNA, herein designated GAM RNA, of GAM337393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337393 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337393 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337393 RNA correlate with, and may be deduced from, the identity of the GAM337393 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337394 6007 CACTTGAACC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGAAGGCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGTTGCAGT Messenger 337394 (GAM337394) oligonucleotides modulates expression of respective target

GAGCTGAGAT genes whose function and utility is known in the art.

TGTGCCATTG GAM337394 is a novel bioinformatically detectable regulatory, non protein

CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337394 was detected

TGGGCAACAA is described with additional reference to Figs. 9-15.

GTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337394 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337394 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337394 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337394 precursor RNA is designated SEQ ID:6007, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6007 is located from position 107752512 to position 107752584 relative to chromosome 5 on the `+` strand.

GAM337394 precursor RNA folds onto itself, forming GAM337394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337394 precursor RNA, designated SEQ ID NO: 6007, and a schematic representation of a predicted secondary folding of GAM337394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337394 folded precursor RNA yielding a GAM337394 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337394 RNA, hereby incorporated herein. Expression of GAM337394 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337394 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337394 target RNA, herein designated GAM TARGET RNA.

GAM337394 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337394 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337394 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337394 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337394 RNA, herein designated GAM RNA, to target binding sites on GAM337394 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337394 target RNA into GAM337394 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337394 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337394 target genes. The mRNA of each one of this plurality of GAM337394 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337394 RNA, herein designated GAM RNA, and which when bound by GAM337394 RNA causes inhibition of translation of the GAM337394 target mRNA into a corresponding GAM337394 target protein.

The mechanism of the translational inhibition exerted by GAM337394 RNA, herein designated GAM RNA, on one or more GAM337394 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337394 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337394 RNA, herein designated GAM RNA, of GAM337394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337394 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337394 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337394 RNA correlate with, and may be deduced from, the identity of the GAM337394 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337395 7181 TGAGGTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACTCGGGAG Messenger 337395 (GAM337395) oligonucleotides modulates expression of respective target

GGGAGGCTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM337395 is a novel bioinformatically detectable regulatory, non protein

GATCACACAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337395 was detected

CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AACAAAGTGA encoded by the human genome.

GACCCCCATC GAM337395 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCA GAM337395 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337395 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337395 precursor RNA is designated SEQ ID:7181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7181 is located from position 108115430 to position 108115532

relative to chromosome 2 on the `+` strand.

GAM337395 precursor RNA folds onto itself, forming GAM337395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337395 precursor RNA, designated SEQ ID NO: 7181, and a schematic representation of a predicted secondary folding of GAM337395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337395 folded precursor RNA yielding a GAM337395 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337395 RNA, hereby incorporated herein. Expression of GAM337395 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337395 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337395 target RNA, herein designated GAM TARGET RNA.

GAM337395 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337395 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337395 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337395 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337395 RNA, herein designated GAM RNA, to target binding sites on GAM337395 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337395 target RNA into GAM337395 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337395 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337395 target genes. The mRNA of each one of this plurality of GAM337395 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337395 RNA, herein designated GAM RNA, and which when bound by GAM337395 RNA causes inhibition of translation of the GAM337395 target mRNA into a corresponding GAM337395 target protein.

The mechanism of the translational inhibition exerted by GAM337395 RNA, herein designated GAM RNA, on one or more GAM337395 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337395 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337395 RNA, herein designated GAM RNA, of GAM337395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337395 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337395 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337395 RNA correlate with, and may be deduced from, the identity of the GAM337395 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337396 6659 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACTCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGGGAGGC Messenger 337396 (GAM337396) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACA GAM337396 is a novel bioinformatically detectable regulatory, non protein

CACCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337396 was detected

CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGACC encoded by the human genome.

GAM337396 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337396 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337396 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337396 precursor RNA is designated SEQ ID:6659, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6659 is located from position 108115437 to position 108115523 relative to chromosome 2 on the `+` strand.

GAM337396 precursor RNA folds onto itself, forming GAM337396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337396 precursor RNA, designated SEQ ID NO: 6659, and a schematic representation of a predicted secondary folding of GAM337396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337396 folded precursor RNA yielding a GAM337396 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337396 RNA, hereby incorporated herein. Expression of GAM337396 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337396 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337396 target RNA, herein designated GAM TARGET RNA.

GAM337396 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337396 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337396 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337396 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337396 RNA, herein designated GAM RNA, to target binding sites on GAM337396 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337396 target RNA into GAM337396 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337396 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337396 target genes. The mRNA of each one of this plurality of GAM337396 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337396 RNA, herein designated GAM RNA, and which when bound by GAM337396 RNA causes inhibition of translation of the GAM337396 target mRNA into a corresponding GAM337396 target protein.

The mechanism of the translational inhibition exerted by GAM337396 RNA, herein designated GAM RNA, on one or more GAM337396 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337396 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337396 RNA, herein designated GAM RNA, of GAM337396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337396 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337396 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337396 RNA correlate with, and may be deduced from, the identity of the GAM337396 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337397 7055 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGGGAGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCTGCAGT Messenger 337397 (GAM337397) oligonucleotides modulates expression of respective target

GAGCCAAGAT genes whose function and utility is known in the art.

CACACACCAC GAM337397 is a novel bioinformatically detectable regulatory, non protein
TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337397 was detected
CCTGGGCAAC is described with additional reference to Figs. 9-15.

AAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337397 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337397 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337397 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337397 precursor RNA is designated SEQ ID:7055, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7055 is located from position 108115443 to position 108115519 relative to chromosome 2 on the `+` strand.

GAM337397 precursor RNA folds onto itself, forming GAM337397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337397 precursor RNA, designated SEQ ID NO: 7055, and a schematic representation of a predicted secondary folding of GAM337397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337397 folded precursor RNA yielding a GAM337397 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337397 RNA, hereby incorporated herein. Expression of GAM337397 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337397 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337397 target RNA, herein designated GAM TARGET RNA.

GAM337397 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337397 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337397 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337397 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337397 RNA, herein designated GAM RNA, to target binding sites on GAM337397 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337397 target RNA into GAM337397 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337397 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337397 target genes. The mRNA of each one of this plurality of GAM337397 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337397 RNA, herein designated GAM RNA, and which when bound by GAM337397 RNA causes inhibition of translation of the GAM337397 target mRNA into a corresponding GAM337397 target protein.

The mechanism of the translational inhibition exerted by GAM337397 RNA, herein designated GAM RNA, on one or more GAM337397 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337397 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337397 RNA, herein designated GAM RNA, of GAM337397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337397 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337397 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337397 RNA correlate with, and may be deduced from, the identity of the GAM337397 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337399 7179 TGAGGTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACTCGGGAG Messenger 337399 (GAM337399) oligonucleotides modulates expression of respective target
GGGAGGCTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM337399 is a novel bioinformatically detectable regulatory, non protein
GATCACACAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337399 was detected
CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAAAGTGA encoded by the human genome.

GACCCCCATC GAM337399 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TCA GAM337399 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337399 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337399 precursor RNA is designated SEQ ID:7179, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7179 is located from position 108732269 to position 108732371 relative to chromosome 2 on the `+` strand.

GAM337399 precursor RNA folds onto itself, forming GAM337399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337399 precursor RNA, designated SEQ ID NO: 7179, and a schematic representation of a predicted secondary folding of GAM337399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337399 folded precursor RNA yielding a GAM337399 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337399 RNA, hereby incorporated herein.

Expression of GAM337399 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337399 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337399 target RNA, herein designated GAM TARGET RNA.

GAM337399 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337399 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337399 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337399 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337399 RNA, herein designated GAM RNA, to target binding sites on GAM337399 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337399 target RNA into GAM337399 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337399 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337399 target genes. The mRNA of each one of this plurality of GAM337399 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337399 RNA, herein designated GAM RNA, and which when bound by GAM337399 RNA causes inhibition of translation of the GAM337399 target mRNA into a corresponding GAM337399 target protein.

The mechanism of the translational inhibition exerted by GAM337399 RNA, herein designated GAM RNA, on one or more GAM337399 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337399 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337399 RNA, herein designated GAM RNA, of GAM337399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337399 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337399 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337399 RNA correlate with, and may be deduced from, the identity of the GAM337399 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337400 6618 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACTCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGGGAGGC Messenger 337400 (GAM337400) oligonucleotides modulates expression of respective target
TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACA GAM337400 is a novel bioinformatically detectable regulatory, non protein
CACCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337400 was detected
CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAGACC encoded by the human genome.

GAM337400 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337400 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337400 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337400 precursor RNA is designated SEQ ID:6618, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6618 is located from position 108732276 to position 108732362 relative to chromosome 2 on the `+` strand.

GAM337400 precursor RNA folds onto itself, forming GAM337400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337400 precursor RNA, designated SEQ ID NO: 6618, and a schematic representation of a predicted secondary folding of GAM337400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337400 folded precursor RNA yielding a GAM337400 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337400 RNA, hereby incorporated herein. Expression of GAM337400 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337400 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337400 target RNA, herein designated GAM TARGET RNA.

GAM337400 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337400 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337400 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337400 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337400 RNA, herein designated GAM RNA, to target binding sites on GAM337400 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337400 target RNA into GAM337400 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337400 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337400 target genes. The mRNA of each one of this plurality of GAM337400 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337400 RNA, herein designated GAM RNA, and which when bound by GAM337400 RNA causes inhibition of translation of the GAM337400 target mRNA into a corresponding GAM337400 target protein.

The mechanism of the translational inhibition exerted by GAM337400 RNA, herein designated GAM RNA, on one or more GAM337400 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337400 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337400 RNA, herein designated GAM RNA, of GAM337400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337400 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337400 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337400 RNA correlate with, and may be deduced from, the identity of the GAM337400 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACA GAM337401 is a novel bioinformatically detectable regulatory, non protein
CACCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337401 was detected
CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAGACCC encoded by the human genome.

GAM337401 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337401 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337401 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337401 precursor RNA is designated SEQ ID:6619, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6619 is located from position 108732276 to position 108732363 relative to chromosome 2 on the `+` strand.

GAM337401 precursor RNA folds onto itself, forming GAM337401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337401 precursor RNA, designated SEQ ID NO: 6619, and a schematic representation of a predicted secondary folding of GAM337401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337401 folded precursor RNA yielding a GAM337401 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337401 RNA, hereby incorporated herein. Expression of GAM337401 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337401 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337401 target RNA, herein designated GAM TARGET RNA.

GAM337401 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337401 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337401 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337401 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337401 RNA, herein designated GAM RNA, to target binding sites on GAM337401 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337401 target RNA into GAM337401 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337401 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337401 target genes. The mRNA of each one of this plurality of GAM337401 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337401 RNA,

herein designated GAM RNA, and which when bound by GAM337401 RNA causes inhibition of translation of the GAM337401 target mRNA into a corresponding GAM337401 target protein.

The mechanism of the translational inhibition exerted by GAM337401 RNA, herein designated GAM RNA, on one or more GAM337401 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337401 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337401 RNA, herein designated GAM RNA, of GAM337401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337401 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337401 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337401 RNA correlate with, and may be deduced from, the identity of the GAM337401 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337402 7004 TCACTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGGGAGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCTGCAGT Messenger 337402 (GAM337402) oligonucleotides modulates expression of respective target

GAGCCAAGAT genes whose function and utility is known in the art.

CACACACCAC GAM337402 is a novel bioinformatically detectable regulatory, non protein

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337402 was detected

CCTGGGCAAC is described with additional reference to Figs. 9-15.

AAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337402 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337402 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337402 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337402 precursor RNA is designated SEQ ID:7004, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7004 is located from position 108732282 to position 108732358 relative to chromosome 2 on the `+` strand.

GAM337402 precursor RNA folds onto itself, forming GAM337402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337402 precursor RNA, designated SEQ ID NO: 7004, and a schematic representation of a predicted secondary folding of GAM337402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337402 folded precursor RNA yielding a GAM337402 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337402 RNA, hereby incorporated herein. Expression of GAM337402 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337402 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337402 target RNA, herein designated GAM TARGET RNA.

GAM337402 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337402 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337402 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337402 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337402 RNA, herein designated GAM RNA, to target binding sites on GAM337402 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337402 target RNA into GAM337402 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337402 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337402 target genes. The mRNA of each one of this plurality of GAM337402 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337402 RNA, herein designated GAM RNA, and which when bound by GAM337402 RNA causes inhibition of translation of the GAM337402 target mRNA into a corresponding GAM337402 target protein.

The mechanism of the translational inhibition exerted by GAM337402 RNA, herein designated GAM RNA, on one or more GAM337402 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337402 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337402 RNA, herein designated GAM RNA, of GAM337402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337402 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337402 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337402 RNA correlate with, and may be deduced from, the identity of the GAM337402 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337403 7011 TCAGTCCCTT Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGGTGTGAC detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTTTCATGT genes whose function and utility is known in the art.

TACCATTGAC GAM337403 is a novel bioinformatically detectable regulatory, non protein
ATCTTCAGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337403 was detected
TTTCAATGTG is described with additional reference to Figs. 9-15.

ATGTGTAATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CATATAAGCA encoded by the human genome.

GCATATGTAG GAM337403 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGGTTGA GAM337403 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337403 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337403 precursor RNA is designated SEQ ID:7011, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7011 is located from position 109155677 to position 109155783 relative to chromosome 8 on the `+` strand.

GAM337403 precursor RNA folds onto itself, forming GAM337403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337403 precursor RNA, designated SEQ ID NO: 7011, and a schematic representation of a predicted secondary folding of GAM337403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337403 folded precursor RNA yielding a GAM337403 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337403 RNA, hereby incorporated herein.

GAM337403 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337403 target RNA, herein designated GAM TARGET RNA.

GAM337403 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337403 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337403 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337403 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337403 RNA, herein designated GAM RNA, to target binding sites on GAM337403 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337403 target RNA into GAM337403 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337403 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337403 target genes. The mRNA of each one of this plurality of GAM337403 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337403 RNA, herein designated GAM RNA, and which when bound by GAM337403 RNA causes inhibition of translation of the GAM337403 target mRNA into a corresponding GAM337403 target protein.

The mechanism of the translational inhibition exerted by GAM337403 RNA, herein designated GAM RNA, on one or more GAM337403 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337403 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337403 RNA, herein designated GAM RNA, of GAM337403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337403 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337403 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337403 RNA correlate with, and may be deduced from, the identity of the GAM337403 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337405 6206 CTGAGGCAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAATTGCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTACCCGGGA Messenger 337405 (GAM337405) oligonucleotides modulates expression of respective target
GGTGAAGGTT genes whose function and utility is known in the art.

GCAGTGAGCC GAM337405 is a novel bioinformatically detectable regulatory, non protein
GAGATGGTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337405 was detected
CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAGAGCAA encoded by the human genome.

GGCCCTGTTT GAM337405 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CAG GAM337405 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337405 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337405 precursor RNA is designated SEQ ID:6206, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6206 is located from position 109967299 to position 109967401 relative to chromosome 4 on the `+` strand.

GAM337405 precursor RNA folds onto itself, forming GAM337405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337405 precursor RNA, designated SEQ ID NO: 6206, and a schematic representation of a predicted secondary folding of GAM337405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337405 folded precursor RNA yielding a GAM337405 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337405 RNA, hereby incorporated herein. Expression of GAM337405 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337405 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337405 target RNA, herein designated GAM TARGET RNA.

GAM337405 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337405 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337405 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337405 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337405 RNA, herein designated GAM RNA, to target binding sites on GAM337405 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337405 target RNA into GAM337405 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337405 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337405 target genes. The mRNA of each one of this plurality of GAM337405 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337405 RNA, herein designated GAM RNA, and which when bound by GAM337405 RNA causes inhibition of translation of the GAM337405 target mRNA into a corresponding GAM337405 target protein.

The mechanism of the translational inhibition exerted by GAM337405 RNA, herein designated GAM RNA, on one or more GAM337405 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337405 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337405 RNA, herein designated GAM RNA, of GAM337405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337405 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337405 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337405 RNA correlate with, and may be deduced from, the identity of the GAM337405 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337407 5915 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337407 (GAM337407) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337407 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337407 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337407 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337407 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337407 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337407 precursor RNA is designated SEQ ID:5915, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5915 is located from position 110039924 to position 110040005 relative to chromosome 5 on the `-` strand.

GAM337407 precursor RNA folds onto itself, forming GAM337407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337407 precursor RNA, designated SEQ ID NO: 5915, and a schematic representation of a predicted secondary folding of GAM337407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337407 folded precursor RNA yielding a GAM337407 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337407 RNA, hereby incorporated herein.

GAM337407 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337407 target RNA, herein designated GAM TARGET RNA.

GAM337407 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337407 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337407 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337407 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337407 RNA, herein designated GAM RNA, to target binding sites on GAM337407 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337407 target RNA into GAM337407 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337407 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337407 target genes. The mRNA of each one of this plurality of GAM337407 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337407 RNA, herein designated GAM RNA, and which when bound by GAM337407 RNA causes inhibition of translation of the GAM337407 target mRNA into a corresponding GAM337407 target protein.

The mechanism of the translational inhibition exerted by GAM337407 RNA, herein designated GAM RNA, on one or more GAM337407 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337407 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337407 RNA, herein designated GAM RNA, of GAM337407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337407 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337407 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337407 RNA correlate with, and may be deduced from, the identity of the GAM337407 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337408 7287 TTAGGAAAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TCCCCTGGGA GAM337408 is a novel bioinformatically detectable regulatory, non protein
TCCTCTGGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337408 was detected
ATGCTGTGAG is described with additional reference to Figs. 9-15.

AACTGCTAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTAG encoded by the human genome.

GAM337408 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337408 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337408 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337408 precursor RNA is designated SEQ ID:7287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7287 is located from position 110149400 to position 110149483 relative to chromosome 7 on the `+` strand.

GAM337408 precursor RNA folds onto itself, forming GAM337408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337408 precursor RNA, designated SEQ ID NO: 7287, and a schematic representation of a predicted secondary folding of GAM337408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337408 folded precursor RNA yielding a GAM337408 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337408 RNA, hereby incorporated herein.

GAM337408 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337408 target RNA, herein designated GAM TARGET RNA.

GAM337408 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337408 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337408 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337408 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337408 RNA, herein designated GAM RNA, to target binding sites on GAM337408 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337408 target RNA into GAM337408 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337408 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337408 target genes. The mRNA of each one of this plurality of GAM337408 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337408 RNA, herein designated GAM RNA, and which when bound by GAM337408 RNA causes inhibition of translation of the GAM337408 target mRNA into a corresponding GAM337408 target protein.

The mechanism of the translational inhibition exerted by GAM337408 RNA, herein designated GAM RNA, on one or more GAM337408 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337408 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337408 RNA, herein designated GAM RNA, of GAM337408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337408 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337408 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337408 RNA correlate with, and may be deduced from, the identity of the GAM337408 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACA GAM337410 is a novel bioinformatically detectable regulatory, non protein

CACCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337410 was detected

CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGACC encoded by the human genome.

GAM337410 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337410 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337410 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337410 precursor RNA is designated SEQ ID:6660, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6660 is located from position 110164986 to position 110165072 relative to chromosome 2 on the `+` strand.

GAM337410 precursor RNA folds onto itself, forming GAM337410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337410 precursor RNA, designated SEQ ID NO: 6660, and a schematic representation of a predicted secondary folding of GAM337410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337410 folded precursor RNA yielding a GAM337410 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337410 RNA, hereby incorporated herein. Expression of GAM337410 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337410 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337410 target RNA, herein designated GAM TARGET RNA.

GAM337410 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337410 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337410 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337410 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337410 RNA, herein designated GAM RNA, to target binding sites on GAM337410 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337410 target RNA into GAM337410 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337410 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337410 target genes. The mRNA of each one of this plurality of GAM337410 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337410 RNA, herein designated GAM RNA, and which when bound by GAM337410 RNA causes inhibition of translation of the GAM337410 target mRNA into a corresponding GAM337410 target protein.

The mechanism of the translational inhibition exerted by GAM337410 RNA, herein designated GAM RNA, on one or more GAM337410 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337410 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337410 RNA, herein designated GAM RNA, of GAM337410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337410 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337410 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337410 RNA correlate with, and may be deduced from, the identity of the GAM337410 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337411 7056 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGGGAGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCTGCAGT Messenger 337411 (GAM337411) oligonucleotides modulates expression of respective target

GAGCCAAGAT genes whose function and utility is known in the art.

CACACACCAC GAM337411 is a novel bioinformatically detectable regulatory, non protein

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337411 was detected

CCTGGGCAAC is described with additional reference to Figs. 9-15.

AAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337411 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337411 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337411 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337411 precursor RNA is designated SEQ ID:7056, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7056 is located from position 110164992 to position 110165068 relative to chromosome 2 on the `+` strand.

GAM337411 precursor RNA folds onto itself, forming GAM337411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337411 precursor RNA, designated SEQ ID NO: 7056, and a schematic representation of a predicted secondary folding of GAM337411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337411 folded precursor RNA yielding a GAM337411 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337411 RNA, hereby incorporated herein. Expression of GAM337411 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337411 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337411 target RNA, herein designated GAM TARGET RNA.

GAM337411 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337411 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337411 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337411 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337411 RNA, herein designated GAM RNA, to target binding sites on GAM337411 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337411 target RNA into GAM337411 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337411 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337411 target genes. The mRNA of each one of this plurality of GAM337411 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337411 RNA, herein designated GAM RNA, and which when bound by GAM337411 RNA causes inhibition of translation of the GAM337411 target mRNA into a corresponding GAM337411 target protein.

The mechanism of the translational inhibition exerted by GAM337411 RNA, herein designated GAM RNA, on one or more GAM337411 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337411 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337411 RNA, herein designated GAM RNA, of GAM337411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337411 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337411 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337411 RNA correlate with, and may be deduced from, the identity of the GAM337411 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337413 7111 TGAGGCACGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCAGGAG Messenger 337413 (GAM337413) oligonucleotides modulates expression of respective target
GCGGAGGCTG genes whose function and utility is known in the art.

CAGTGAGCAG GAM337413 is a novel bioinformatically detectable regulatory, non protein
AGATCACGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337413 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGGGAG encoded by the human genome.

ACTCTGTCTC GAM337413 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM337413 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337413 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337413 precursor RNA is designated SEQ ID:7111, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7111 is located from position 110356261 to position 110356361 relative to chromosome 12 on the `+` strand.

GAM337413 precursor RNA folds onto itself, forming GAM337413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337413 precursor RNA, designated SEQ ID NO: 7111, and a schematic representation of a predicted secondary folding of GAM337413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337413 folded precursor RNA yielding a GAM337413 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337413 RNA, hereby incorporated herein. Expression of GAM337413 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337413 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337413 target RNA, herein designated GAM TARGET RNA.

GAM337413 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337413 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337413 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337413 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337413 RNA, herein designated GAM RNA, to target binding sites on GAM337413 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337413 target RNA into GAM337413 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337413 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337413 target genes. The mRNA of each one of this plurality of GAM337413 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337413 RNA, herein designated GAM RNA, and which when bound by GAM337413 RNA causes inhibition of translation of the GAM337413 target mRNA into a corresponding GAM337413 target protein.

The mechanism of the translational inhibition exerted by GAM337413 RNA, herein designated GAM RNA, on one or more GAM337413 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337413 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337413 RNA, herein designated GAM RNA, of GAM337413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337413 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337413 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337413 RNA correlate with, and may be deduced from, the identity of the GAM337413 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337414 6041 CATGTTGGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

GTAACTCCAG Messenger 337414 (GAM337414) oligonucleotides modulates expression of respective target
ACTTCAGGTG genes whose function and utility is known in the art.

ATCTGCCCAC GAM337414 is a novel bioinformatically detectable regulatory, non protein
CTTGGCCTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337414 was detected
CAAAGTGCTG is described with additional reference to Figs. 9-15.

GGATTACAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTGAGCCAC encoded by the human genome.

CATG GAM337414 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337414 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337414 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337414 precursor RNA is designated SEQ ID:6041, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6041 is located from position 110439070 to position 110439163 relative to chromosome 10 on the `-` strand.

GAM337414 precursor RNA folds onto itself, forming GAM337414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337414 precursor RNA, designated SEQ ID NO: 6041, and a schematic representation of a predicted secondary folding of GAM337414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337414 folded precursor RNA yielding a GAM337414 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337414 RNA, hereby incorporated herein.

GAM337414 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337414 target RNA, herein designated GAM TARGET RNA.

GAM337414 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337414 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337414 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337414 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337414 RNA, herein designated GAM RNA, to target binding sites on GAM337414 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337414 target RNA into GAM337414 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337414 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337414 target genes. The mRNA of each one of this plurality of GAM337414 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337414 RNA, herein designated GAM RNA, and which when bound by GAM337414 RNA causes inhibition of translation of the GAM337414 target mRNA into a corresponding GAM337414 target protein.

The mechanism of the translational inhibition exerted by GAM337414 RNA, herein designated GAM RNA, on one or more GAM337414 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337414 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337414 RNA, herein designated GAM RNA, of

GAM337414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337414 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337414 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337414 RNA correlate with, and may be deduced from, the identity of the GAM337414 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337415 7183 TGAGGTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AACTCGGGAG Messenger 337415 (GAM337415) oligonucleotides modulates expression of respective target

GGGAGGCTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM337415 is a novel bioinformatically detectable regulatory, non protein

GATCACACAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337415 was detected

CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AACAAAGTGA encoded by the human genome.

GACCCCCATC GAM337415 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCA GAM337415 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337415 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337415 precursor RNA is designated SEQ ID:7183, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7183 is located from position 110894746 to position 110894848 relative to chromosome 2 on the `-` strand.

GAM337415 precursor RNA folds onto itself, forming GAM337415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337415 precursor RNA, designated SEQ ID NO: 7183, and a schematic representation of a predicted secondary folding of GAM337415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337415 folded precursor RNA yielding a GAM337415 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337415 RNA, hereby incorporated herein. Expression of GAM337415 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337415 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337415 target RNA, herein designated GAM TARGET RNA.

GAM337415 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337415 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337415 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337415 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337415 RNA, herein designated GAM RNA, to target binding sites on GAM337415 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337415 target RNA into GAM337415 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337415 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337415 target genes. The mRNA of each one of this plurality of GAM337415 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337415 RNA, herein designated GAM RNA, and which when bound by GAM337415 RNA causes inhibition of translation of the GAM337415 target mRNA into a corresponding GAM337415 target protein.

The mechanism of the translational inhibition exerted by GAM337415 RNA, herein designated GAM RNA, on one or more GAM337415 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337415 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337415 RNA, herein designated GAM RNA, of GAM337415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAGACC encoded by the human genome.

GAM337416 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337416 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337416 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337416 precursor RNA is designated SEQ ID:6661, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6661 is located from position 110894755 to position 110894841 relative to chromosome 2 on the `-` strand.

GAM337416 precursor RNA folds onto itself, forming GAM337416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337416 precursor RNA, designated SEQ ID NO: 6661, and a schematic representation of a predicted secondary folding of GAM337416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337416 folded precursor RNA yielding a GAM337416 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337416 RNA, hereby incorporated herein. Expression of GAM337416 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337416 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337416 target RNA, herein designated GAM TARGET RNA.

GAM337416 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337416 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337416 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337416 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337416 RNA, herein designated GAM RNA, to target binding sites on GAM337416 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337416 target RNA into GAM337416 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337416 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337416 target genes. The mRNA of each one of this plurality of GAM337416 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337416 RNA, herein designated GAM RNA, and which when bound by GAM337416 RNA causes inhibition of translation of the GAM337416 target mRNA into a corresponding GAM337416 target protein.

The mechanism of the translational inhibition exerted by GAM337416 RNA, herein designated GAM RNA, on one or more GAM337416 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337416 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337416 RNA, herein designated GAM RNA, of GAM337416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337416 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337416 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337416 RNA correlate with, and may be deduced from, the identity of the GAM337416 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337417 7057 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGGGAGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCTGCAGT Messenger 337417 (GAM337417) oligonucleotides modulates expression of respective target

GAGCCAAGAT genes whose function and utility is known in the art.

CACACACCAC GAM337417 is a novel bioinformatically detectable regulatory, non protein

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337417 was detected

CCTGGGCAAC is described with additional reference to Figs. 9-15.

AAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337417 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337417 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337417 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337417 precursor RNA is designated SEQ ID:7057, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7057 is located from position 110894759 to position 110894835 relative to chromosome 2 on the `-` strand.

GAM337417 precursor RNA folds onto itself, forming GAM337417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337417 precursor RNA, designated SEQ ID NO: 7057, and a schematic representation of a predicted secondary folding of GAM337417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337417 folded precursor RNA yielding a GAM337417 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337417 RNA, hereby incorporated herein. Expression of GAM337417 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337417 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337417 target RNA, herein designated GAM TARGET RNA.

GAM337417 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337417 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337417 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337417 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337417 RNA, herein designated GAM RNA, to target binding sites on GAM337417 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337417 target RNA into GAM337417 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337417 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337417 target genes. The mRNA of each one of this plurality of GAM337417 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337417 RNA, herein designated GAM RNA, and which when bound by GAM337417 RNA causes inhibition of translation of the GAM337417 target mRNA into a corresponding GAM337417 target protein.

The mechanism of the translational inhibition exerted by GAM337417 RNA, herein designated GAM RNA, on one or more GAM337417 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337417 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337417 RNA, herein designated GAM RNA, of GAM337417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337417 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337417 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337417 RNA correlate with, and may be deduced from, the identity of the GAM337417 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337418 6178 CTCTGTCACC CAGGCTGGAG TGAGTGTGAT CTTGGCTCAC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337418 (GAM337418) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GGCAACCTTT GAM337418 is a novel bioinformatically detectable regulatory, non protein
GCCTCCTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337418 was detected
TTCAAGCAAT is described with additional reference to Figs. 9-15.

TCTCCTGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAGCCTCCCG encoded by the human genome.

AGTAGCAGAG GAM337418 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337418 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337418 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337418 precursor RNA is designated SEQ ID:6178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6178 is located from position 111066449 to position 111066548 relative to chromosome 12 on the `+` strand.

GAM337418 precursor RNA folds onto itself, forming GAM337418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337418 precursor RNA, designated SEQ ID NO: 6178, and a schematic representation of a predicted secondary folding of GAM337418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337418 folded precursor RNA yielding a GAM337418 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337418 RNA, hereby incorporated herein.

GAM337418 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337418 target RNA, herein designated GAM TARGET RNA.

GAM337418 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337418 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337418 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337418 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337418 RNA, herein designated GAM RNA, to target binding sites on GAM337418 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337418 target RNA into GAM337418 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337418 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337418 target genes. The mRNA of each one of this plurality of GAM337418 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337418 RNA, herein designated GAM RNA, and which when bound by GAM337418 RNA causes inhibition of translation of the GAM337418 target mRNA into a corresponding GAM337418 target protein.

The mechanism of the translational inhibition exerted by GAM337418 RNA, herein designated GAM RNA, on one or more GAM337418 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337418 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337418 RNA, herein designated GAM RNA, of GAM337418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337418 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337418 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337418 RNA correlate with, and may be deduced from, the identity of the GAM337418 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337419 7294 TTCAGGTTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTAGTAGA Messenger 337419 (GAM337419) oligonucleotides modulates expression of respective target

ACAGAATATT genes whose function and utility is known in the art.

TTAGCTCTGA GAM337419 is a novel bioinformatically detectable regulatory, non protein

GGACAATCTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337419 was detected

AGTTATGAAT is described with additional reference to Figs. 9-15.

AGTCTGGTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGTAAGGATT encoded by the human genome.

TGCATAGTTT GAM337419 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGAGAAATGA GAM337419 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

A GAM337419 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337419 precursor RNA is designated SEQ ID:7294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7294 is located from position 111125711 to position 111125821 relative to chromosome 9 on the `+` strand.

GAM337419 precursor RNA folds onto itself, forming GAM337419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337419 precursor RNA, designated SEQ ID NO: 7294, and a schematic representation of a predicted secondary folding of GAM337419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337419 folded precursor RNA yielding a GAM337419 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337419 RNA, hereby incorporated herein.

GAM337419 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337419 target RNA, herein designated GAM TARGET RNA.

GAM337419 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337419 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337419 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337419 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337419 RNA, herein designated GAM RNA, to target binding sites on GAM337419 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337419 target RNA into GAM337419 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337419 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337419 target genes. The mRNA of each one of this plurality of GAM337419 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337419 RNA, herein designated GAM RNA, and which when bound by GAM337419 RNA causes inhibition of translation of the GAM337419 target mRNA into a corresponding GAM337419 target protein.

The mechanism of the translational inhibition exerted by GAM337419 RNA, herein designated GAM RNA, on one or more GAM337419 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337419 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337419 RNA, herein designated GAM RNA, of GAM337419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337419 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337419 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337419 RNA correlate with, and may be deduced from, the identity of the GAM337419 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGAATGACTA is described with additional reference to Figs. 9-15.

TGAGTTATTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGTTTTTCAT encoded by the human genome.

CTGCTCAGGC GAM337420 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
ACCGTGCTGG GAM337420 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GCC GAM337420 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337420 precursor RNA is designated SEQ ID:6748, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6748 is located from position 111321485 to position 111321597 relative to chromosome 11 on the `-` strand.

GAM337420 precursor RNA folds onto itself, forming GAM337420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337420 precursor RNA, designated SEQ ID NO: 6748, and a schematic representation of a predicted secondary folding of GAM337420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337420 folded precursor

RNA yielding a GAM337420 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337420 RNA, hereby incorporated herein.

GAM337420 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337420 target RNA, herein designated GAM TARGET RNA.

GAM337420 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337420 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337420 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337420 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337420 RNA, herein designated GAM RNA, to target binding sites on GAM337420 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337420 target RNA into GAM337420 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337420 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337420 target genes. The mRNA of each one of this plurality of GAM337420 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337420 RNA, herein designated GAM RNA, and which when bound by GAM337420 RNA causes inhibition of translation of the GAM337420 target mRNA into a corresponding GAM337420 target protein.

The mechanism of the translational inhibition exerted by GAM337420 RNA, herein designated GAM RNA, on one or more GAM337420 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337420 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337420 RNA, herein designated GAM RNA, of GAM337420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337420 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337420 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337420 RNA correlate with, and may be deduced from, the identity of the GAM337420 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCTGGTGTTG genes whose function and utility is known in the art.

TGCCCGGGGT GAM337421 is a novel bioinformatically detectable regulatory, non protein

ACAACACGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337421 was detected

GTAGGTGTTC is described with additional reference to Figs. 9-15.

GATAAACTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTTGGATAA encoded by the human genome.

ATGGAAGA GAM337421 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337421 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337421 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337421 precursor RNA is designated SEQ ID:7078, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7078 is located from position 111340859 to position 111340956 relative to chromosome 12 on the `+` strand.

GAM337421 precursor RNA folds onto itself, forming GAM337421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337421 precursor RNA, designated SEQ ID NO: 7078, and a schematic representation of a predicted secondary folding of GAM337421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337421 folded precursor RNA yielding a GAM337421 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337421 RNA, hereby incorporated herein.

GAM337421 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337421 target RNA, herein designated GAM TARGET RNA.

GAM337421 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337421 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337421 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337421 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337421 RNA, herein designated GAM RNA, to target binding sites on GAM337421 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337421 target RNA into GAM337421 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337421 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337421 target genes. The mRNA of each one of this plurality of GAM337421 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337421 RNA, herein designated GAM RNA, and which when bound by GAM337421 RNA causes inhibition of translation of the GAM337421 target mRNA into a corresponding GAM337421 target protein.

The mechanism of the translational inhibition exerted by GAM337421 RNA, herein designated GAM RNA, on one or more GAM337421 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337421 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337421 RNA, herein designated GAM RNA, of GAM337421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337421 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337421 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337421 RNA correlate with, and may be deduced from, the identity of the GAM337421 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337424 6720 GGATGGCTTG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGTCCAGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGGAGGTTG Messenger 337424 (GAM337424) oligonucleotides modulates expression of respective target
CAGTGAACAG genes whose function and utility is known in the art.

AGATTGTGTC GAM337424 is a novel bioinformatically detectable regulatory, non protein
ACTGCACTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337424 was detected
AGCCTGGGCA is described with additional reference to Figs. 9-15.

ACAGAGCGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACC encoded by the human genome.

GAM337424 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337424 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337424 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337424 precursor RNA is designated SEQ ID:6720, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6720 is located from position 111702787 to position 111702869 relative to chromosome 11 on the `+` strand.

GAM337424 precursor RNA folds onto itself, forming GAM337424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337424 precursor RNA, designated SEQ ID NO: 6720, and a schematic representation of a predicted secondary folding of GAM337424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337424 folded precursor RNA yielding a GAM337424 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337424 RNA, hereby incorporated herein.

GAM337424 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337424 target RNA, herein designated GAM TARGET RNA.

GAM337424 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337424 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337424 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337424 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337424 RNA, herein designated GAM RNA, to target binding sites on GAM337424 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337424 target RNA into GAM337424 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337424 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337424 target genes. The mRNA of each one of this

plurality of GAM337424 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337424 RNA, herein designated GAM RNA, and which when bound by GAM337424 RNA causes inhibition of translation of the GAM337424 target mRNA into a corresponding GAM337424 target protein.

The mechanism of the translational inhibition exerted by GAM337424 RNA, herein designated GAM RNA, on one or more GAM337424 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337424 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337424 RNA, herein designated GAM RNA, of GAM337424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337424 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337424 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337424 RNA correlate with, and may be deduced from, the identity of the GAM337424 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337425 6564 GCTTGAGTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGAGGTGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTTGCAGTG Messenger 337425 (GAM337425) oligonucleotides modulates expression of respective target

AACAGAGATT genes whose function and utility is known in the art.

GTGTCACTGC GAM337425 is a novel bioinformatically detectable regulatory, non protein

ACTCTAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337425 was detected

GGGCAACAGA is described with additional reference to Figs. 9-15.

GC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337425 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337425 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337425 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337425 precursor RNA is designated SEQ ID:6564, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6564 is located from position 111702792 to position 111702863 relative to chromosome 11 on the `+` strand.

GAM337425 precursor RNA folds onto itself, forming GAM337425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337425 precursor RNA, designated SEQ ID NO: 6564, and a schematic representation of a predicted secondary folding of GAM337425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337425 folded precursor RNA yielding a GAM337425 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337425 RNA, hereby incorporated herein.

GAM337425 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337425 target RNA, herein designated GAM TARGET RNA.

GAM337425 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337425 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337425 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337425 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337425 RNA, herein designated GAM RNA, to target binding sites on GAM337425 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337425 target RNA into GAM337425 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337425 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337425 target genes. The mRNA of each one of this plurality of GAM337425 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337425 RNA, herein designated GAM RNA, and which when bound by GAM337425 RNA causes inhibition of translation of the GAM337425 target mRNA into a corresponding GAM337425 target protein.

The mechanism of the translational inhibition exerted by GAM337425 RNA, herein designated GAM RNA, on one or more GAM337425 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337425 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337425 RNA, herein designated GAM RNA, of GAM337425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337425 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337425 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337425 RNA correlate with, and may be deduced from, the identity of the GAM337425 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337426 5916 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337426 (GAM337426) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337426 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337426 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337426 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337426 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337426 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337426 precursor RNA is designated SEQ ID:5916, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5916 is located from position 111728469 to position 111728550 relative to chromosome 7 on the `+` strand.

GAM337426 precursor RNA folds onto itself, forming GAM337426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337426 precursor RNA, designated SEQ ID NO: 5916, and a schematic representation of a predicted secondary folding of GAM337426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337426 folded precursor RNA yielding a GAM337426 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337426 RNA, hereby incorporated herein.

GAM337426 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337426 target RNA, herein designated GAM TARGET RNA.

GAM337426 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337426 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337426 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337426 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337426 RNA, herein designated GAM RNA, to target binding sites on GAM337426 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337426 target RNA into GAM337426 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337426 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337426 target genes. The mRNA of each one of this plurality of GAM337426 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337426 RNA, herein designated GAM RNA, and which when bound by GAM337426 RNA causes inhibition of translation of the GAM337426 target mRNA into a corresponding GAM337426 target protein.

The mechanism of the translational inhibition exerted by GAM337426 RNA, herein designated GAM RNA, on one or more GAM337426 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337426 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337426 RNA, herein designated GAM RNA, of GAM337426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337426 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337426 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337426 RNA correlate with, and may be deduced from, the identity of the GAM337426 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337428 6344 GAGACAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTGGGAGG Messenger 337428 (GAM337428) oligonucleotides modulates expression of respective target

CAGAGGTTGC genes whose function and utility is known in the art.

GGTTAGCCAA GAM337428 is a novel bioinformatically detectable regulatory, non protein
GATTGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337428 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

TGGGTGACAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAGAGACTC encoded by the human genome.

TGTCTC GAM337428 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337428 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337428 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337428 precursor RNA is designated SEQ ID:6344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6344 is located from position 112035396 to position 112035491 relative to chromosome 12 on the `+` strand.

GAM337428 precursor RNA folds onto itself, forming GAM337428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.
